Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry

D1: FOOD; FERMENTATION

D11: BAKING

HAYB D11 57180V/32 =DS 2402-437
Low calorie food esp bakery prodt - contains pullulane and amylose, having no tendency to stick to the teeth
HAYASHIBARA BIOCHEM 19.01.73-JA-008406
*(08.02.79) *DT2402-437 A21d-13*

A baked prod. contains pullulan (I) and wheat flour or starch (II) in which the wt. ratio of (I):(II) is 1:0.5-5 and 30-170 wt.% (based on (I)) amylose having a degree of poly-msn. of 20-500.

The prod. e.g. bread, biscuits etc., contains the non-toxic and calorie-free (I). It does not adhere to teeth and has a better appearnace and texture than known (I)-contg. prods. 18.1.74 as 402437 (6pp922)

MULL- ★ D11 12134B/07 ★DT 2733-097
Bread slicing machine - having blades passing through solid vegetable fat particles to prevent adhesion of crumbs
MULLER J & SOHNE 22.07.77-DT-733097
P62 (08.02.79) A21c-15/04 B26d-03/24

Pastry and other baked food, e.g. bread, is cut mechanically by blades which are lined on both sides with solid vegetable fat before a cut or at regular intervals.

This prevents crumbs from adhering to the cutters. The solid fat has a much better adhesion than the conventional vegetable oils, it does not oxidise, has no taste, and does not contaminate the machine. 22.7.77 as 733097 (14pp39)

MAUE- ★ D11 12164B/07 ★DT 2734-018
Multideck baking oven - with cantilever shelves on trestle and sealing strips for each deck
MAUERMANN J BACKOF 28.07.77-DT-734018
(08.02.79) A21b-03/07

A baking oven with several decks has, between the oven spaces and the common door, enough space to accommodate the upright frame of a trestle on rollers. Cantilever shelves extend from this frame into each oven deck. Sealing strips around the decks and on the door separate each deck from the next.

This allows smaller quantities of different pastry to be baked under different conditions in each deck. 28.7.77 as 734018 (16pp39)

MECH- ★ D11 12250B/07 ★DT 2831-154
Doughnut icing applicator - with separate dip container for circulating icing from heated storage tank
VEB MECHAN LEIPZIG 26.07.77-DL-200279
(08.02.79) A21b-05/08 A21c-09/04

A device for the icing of pastry, e.g. doughnuts, has in the upper part of a heated storage tank for the icing an immersion container which receives a constant supply from a disc with a scraper and channel and has an overflow. The doughnuts are dipped into this container together with their transport containers.

This saves the manual labour for the application of the icing. It ensures a uniform quality of the icing and recovers all surplus material. 15.7.78 as 831154 (7pp39)

WERN D11 70957Y/40 =GB 1540-694
Dough portion delivering machine with piston and stripper - has compressed air blast releasing dough tending to adhere
WERNER & PFLEIDERER 27.03.76-DT-613139
*(14.02.79) *DT2613-139 A21c-05*

A dough dividing machine comprises a piston moving horizontally through a chamber supplied with dough through a funnel to drive the dough into a dividing chamber which then moves vertically in a direction transvers to the piston. In the lowest position of the chamber a second piston ejects the dough.

A stripper element extends along the width of the dividing chamber to remove the dough piece from the piston face as the chamber rises. A blast of compressed air is delivered radially from a pipe mounted parallel and above the stripper element. The dough piece is dislodged at the moment when the stripper element has traversed almost the full surface of the ejector piston.

Clean delivery of a dough piece from the divider without the need to apply oil is provided. 17.2.77 as 006677 (3pp1364)

TAID ★ D11 12946B/07 ★J5 4002-377
Instant choux prepn. - from aq. emulsion of edible oil and fat, starch, sodium casein and alkali salt; and egg white albumin and wheat protein
TAIYO FOOD KK 03.06.77-JA-066001
(09.01.79) A21d-08

Method comprises (1) heat-treating a mixt. of 100 pts.wt. edible oil and fat, 20-90 pts.wt. starch, 10-30 pts.wt. sodium casein, 0.5-5.0 pts.wt. alkali salt and 200-800 pts.wt. water, at below the gelatinising temp. of starch, (2) homogenising, (3) drying the emulsion instantaneously with hot air, (4) combining 10-40 pts.wt. powdery egg white albumin, 5-20 pts.wt. of active wheat protein and opt. >1 of yolk powder, common salt, colourant and perfume with 100 pts.wt. of the powder obtd. in (3), (5) kneading the obtd. powder with water and (6) baking the obtd. dough.

From the dough, soft voluminous choux can be prepd. stably in a short baking time by a simple cooking process. The dough obtd. in (5) has a moisture content 40-50% and the value is much less than that of conventional dough for choux (by 15-25%). 3.6.77 as 066001 (6pp5)

D12: MEAT; FISH PROCESSING

MUNC- ★ D12 11937B/07 ★BE -870-932
Machine to cut open and clean stomach of chickens, etc. - comprises rotary carrier wheel with pockets contg. the stomach which is carried across the edge of a blade
MUNCHMEYER & CO 03.10.77-DT-744456
(01.02.79) A22b

The machine has a rotary carrier wheel having pockets around its circumference. Each pocket is loaded with a stomach which is carried by wheel rotation across the edge of a blade which cuts open the stomach. The opened stomach is transferred to a subsequent machine which cleans out the stomach. From the loading point to the cutting zone, in the direction of rotation, the vol. of each pocket becomes progressively smaller. On leaving the cutting zone, each stomach is carried along a dividing tool which opens the stomach cut and roots out the callous area.

The carrier wheel is pref. made up of three parallel, circular plates. The outer plates are both concentric with the axis of rotation of the wheel. The sandwiched plate is of smaller dia. than and eccentric to the other two. In the direction of rotation from the loading point the circumference is closely encircled with a pocket pressure plate which is slotted to allow the cutter to reach pocketed stomachs.

Used for cleaning out chicken stomachs and stomachs of other small animals. Stomachs varying over a with range of sizes are all compressed to a similar thickness before meeting the cutting blade. The machine can now be set to ensure adequate cutting of small stomachs without unduly gashing stomachs at the upper end of the size range. 2.10.78 as 870932 (11pp448)

FARH D12 30141X/17 =DS 2447-757
Cellulose hydrate sausage casings - having internal coating containing albumen modified with (alkoxylated) N-methylol-(meth)acrylamide, and humectant
HOECHST AG 07.10.74-DT-447757
*A97 +P42 P73 (A11) (08.02.79) *BE-834-242 A22c-13 B05d-07/02*

Surfaces of mouldings, esp. cellulose hydrate tubing are coated with polymers by applying to the still gel like tubing a liq. layer consisting of an aq. soln. of an albumen condensation product (ACP), warming the coated tubing and moistening it.

The ACP is produced by addn. of the reactive gps. of albumen molecules to the reactive double bonds of aliphatic polyfunctional cpds. contg. ≥1 reactive C=C and ≥1 reactive N-methylol gp. per molecule. These cpds. are pref. N-methylol-(meth)acrylamide or N,N'-methylene-bis-(meth) acrylamide. The albumen is pref. casein.

Method is simple. The tubing is highly suitable for use as sausage skin as it adheres strongly to the sausage filling, preventing unsightly shrinkage, which could allow mould growth at the shrinkage sites. The skins can be easily peeled off. 7.10.74 as 447757 (7pp260)

NMHB ★ D12 12098B/07 ★DS 2753-111
Press liquoring machine for meat or fish - with safety guards for charging area and sideways feed openings
NORDISCH MASCH R BAADER 29.11.77-DT-753111
(08.02.79) A22c-17/04

Press liquoring maching for meat or fish has an inlet opening for the charge covered by a rectangular plate, with access slots below it on two sides. The storage tray for the charge which is attached to the top of the machine has in its bottom a cut-out to suit this plate.

Appts. is easy to charge by sliding the feed material along the bottom of the storage tray. It is wuiable for all sizes and types of plasticity and it operates with a high throughput rate. When the storage tray is removed, it can be run for cleaning without endangering the personnel. 29.11.77 as 753111 (4pp39)

KOLL/ ★ D12 12161B/07 ★DT 2733-996
Sausage skin sheath - made of extruded plastic foil with longitudinal sliding clasp-type fastener
KOLLROSS G 28.07.77-DT-733996
A92 (08.02.79) A22c-13

Lengths of shirred flexible hose, i.e. artificial skins for use in sausage filling machines, are transported and stored in sheaths made of extruded plastic foil. The foil is extruded near one selvage with a nearly closed groove and near the other selvage with a ridge which forms a sliding clasp fastener.

The arrangement provides the desired protection of the skin against damage during storage and transport. When pushed over the filler tube of a sausage machine, the sheath can be easily removed without pulling off the skin with it. 28.7.77 as 733996 (12pp39)

NMHB D12 38621A/22 #GB 1540-686
Fish processing machine feeder - with V/shaped cover in V/shaped conveyor feeder gap
NORDISCH MASCH R BAADER 10.09.77-DT-740820 (18.10.77-GB-043264)
*(14.02.79) *DS2740-820 A22c-25/08*

Appts. for collecting and feeding beheaded fish, belly foremost, to a fish processing machine comprises a V-shaped channel formed between guide plates over whose surface endless bands move; these bands pass around deflecting rollers set at an inclined angle corresp. to that of the guide plates.

A V-shaped cover is positioned at the end of the channel remote from the rollers and has a groove inclined to th channel base to engage the tail end of a fish not travelling head end first; the cover has openings through which wate is supplied. The cover collects fish travelling tail end first and these are withdrawn from the feed zone by the conveying bands; the water supply facilitates the removal of the fish from the cover.

Uninterrupted introduction of different fish sizes into a processing machine is provided 18.10.77 as 043264 (3pp1364)

GRAC D12 10675A/06 =GB 1540-77
Poultry storage and package system - by chilling after sealing draw and pressed chicken in evacuated plastics bags
GRACE W R CO 28.07.76-US-709572
*+Q31 (14.02.79) *DT2733-352 A23b-04/06*

Preparing and preserving poultry comprises washing the eviscerated birds (e.g. with high pressure water sprays) without cooling; the birds are bagged in shrinkable, thermoplastic bags of low gas permeability (e.g. < 100 cc/mil/ m^2/24 hours) which are then evacuated and sealed. The bags are passed through a chiller to reduce body temp. to within the range 26°-34°F before storage at this temp. In the evacuating step the moisture content of the bird is pref. lowered to < 3%.

Freezing of the birds is avoided and purge or weeping is prevented without a series of cooling and freezing step 26.7.77 (5pp1364)

BARO- ★ D12 B/07 ★HU T015-92
Meat hooks for processing plant - esp. in precooling units for poultr processors
BAROMFIFELDOLGOZO 01.12.76-HU-BA3488
(27.01.79) A22b-05

ORSZ- ★ D12 B/07 ★HU T015-92
Meat prods. mfr. - using continuous operating machinery fo producing chopped filler mass
ORSZAGOS HUSIPARI 12.03.76-HU-OA0562
(27.01.79) A22c-05

MATS/ ★ D12 12944B/07 ★J5 4002-36
Smoked fish meat prepn. - comprises adding sodium bi:carbonate di:sodium hydrogen phosphate, sorbite and salt to fish; op washing; drying and smoking
MATSUMURA S 06.06.77-JA-066469
(09.01.79) A23b-04/04 A23l-01/32

The method comprises (1) adding sodim bicarbonate, disodium hydrogen phosphate and sorbite to fish meat, (2) adding common salt to the mixt., (3) opt. washing it wit water, (4) drying it and (5) smoking it. The meat of bonito and other fishes can be processed to soft delicious smoked meat and its pigment is stabilised.

The meat of bonito is structured of the bundle of stron muscle fibres and while it is fresh, the voids between mu sle fibres are filled with blood body fluid, etc. When it is dried or heat-treated, the liq. in the voids is lost and muscle fibres are adhered closely. The muscle fibre is covered with the sheath mainly of collagen and the meat gets hard. By the invented method the sheath can be softened and the pigment in the meat can be stabilised with sodium bicarbonate and disodium hydrogen phosphate. Steps (1) and (2) can take place in reverse order. Sodiun bicarbonate, disodium hydrogen phosphate and sorbite ar sprinkled on fish meat or fish meat is immersed in the a liq. contg. them. Step (3) is used to effect desalting. 6.6.77 as 066469 (3pp5)

KIMU/ D12 55948A/31 =J7 9000-98
Binding meat lumps together - by covering with mixt. of milk casei salt glucono-lactone and gum material opt. contg. milk powder an calcium salt, then gelling
KIMURA S 07.12.76-JA-146215
*(18.01.79) *J53072-854 A23l-01/31 +A22c-11*

The method comprises by mixing water soluble salt of molk casein and opt. molk powder and calcium salt; adding gluconolactone, in an amt. which would make the pH of an aq. soln. of the compsn. ca. 4.6, gradually adding natural gum such as guar gum, locust bean gum, etc. to increase the hygroscopicity and adhesive property of the composition; covering meat lumps with the obtd. powder compsn. and gelling the compsn. gradually by standing, press-moulding or refrigeration.

Usually gluconolactone is used at 15-25% on milk casein. The milk powder and calcium salt assist the binding property of milk casein. 7.12.76 as 146215 A231-1/31; A22c-11/00 (18.1.79) KIMURAS (3pp)(J53072854)

KYOK- D12 59478A/33 =J7 9000-985

Food prod. from Euphausia superba - by boiling without shelling, adding antioxidant, drying, pulverising mixing with organic acid and moulding

KYOKUYO KK 20.12.76-JA-153131

*(18.01.79) *J53079-053 A23l-01/32*

Method comprises boiling Euphausia superba without removing its shell, adding antioxidant to boiled E. superba, drying it to moisture content $<$ 5 wt.% pulverising the dried prod. below 100 mesh, mixing it with organic acid and moulding it to granules or tablets.

Highly nutritive, palatable, digestive and preserved food can be prepd. from E. superba.

As antioxidant tocopherol 0.01-0.05 w/w% or ascorbic acid or its alkali salt 0.05-0.1 w/w% is applied singly or together. By drying unpalatable components and amine-like components can be removed. The drying should be practised to moisture content $<$ 5w/w%, favourably $<$ 3-w/w% and the preservative properties can be improved remarkably. 20.12.76 as 153131 A23d-1/325 (18.1.79) KYOKUYO KK (3pp)(J53079053)

POPR= ★ D12 13628B/07 ★SU-599-781

Fine meat mincer for sausage meat prodn. - to which coarsely minced meat is fed and passes through stages of paired movable and stationary knives

POLT PROVISION MACH 16.09.75-SU-174399

(13.03.78) A22c-17

Equipment for fine mincing of meat, during the prodn. of minced meat for sausages and cutlets, as well as raw fatty materials, fish, etc., consists of a loading head, body with an assembly of fixed circular toothed knives, a rotor mounted on a shaft inside the body plus a loading wheel, and an assembly of movable circular toothed knives, and a mechanism to control the distance between the front cutting edges of both sets of knives, together with a loading channel.

Productivity is increased, due to much finer mincing, by increasing the diameter of the movable knives proceeding in a direction towards the discharge channel. The widths of the paired stationary knives are reduced. Each tooth of both sets of knives has two cutting edges - one along the edge of the tooth and the other on the top head of the tooth. The knives are mounted on the rotor shaft and can move along it by means of an elastic buffer. The gaps between the teeth are equal.

Paramonov, V.A., Taturevich, A.N., Batishchev, V.P. Bul. 12/30.3.78. 16.9.75 as 174399 (4pp29)

UZME= ★ D12 13629B/07 ★SU-599-782

Cutter for meat used in soups etc. - has toothed disc knives to convert meat into strips and transverse flat knives to cut strips into small lumps

UZB MEAT DAIRY MIN 27.12.76-SU-437040

P62 (11.04.78) A22c-17 B26d-04/24

Equipment for cutting meat into lumps has an attachment for feeding the meat to be cut, disc knives mounted vertically on shafts, and an attachment to remove the lumps as they are cut.

Quality of cut is improved by positioning guiding plates, with slots to allow the disc knives to pass through, in front of flat knives, plus an extra attachment to take away the cut lumps.

The flat knives and removal attachments are made as assemblies of plates fitted longitudinally on to shafts. The meat feeding attachment is a trough mounted in front of the disc knives. Each shaft of the flat knives is kinematically connected to the corresp. shaft of the meat-removing attachment. The disc and flat knives shafts are installed so that the knives rotate towards one another.

Gulyammakhmudov, A.G., Lankov, V.I. Bul. 12/30.3.78 27.12.76 as 437040 (3pp29)

AZCH= ★ D12 13630B/07 ★SU-599-783

Appts. for sorting fish according to thickness - has chain conveyors with sorting grilles formed by rollers, above which brushes rotate

AZCHERRYBA BUR 12.11.75-SU-189378

(13.03.78) A22c-25/04

Equipment for sorting fish according to thickness, on production lines for processing smaller fish, such as anchovies, sprats, etc., in ship and shore establishments, consists of chain conveyor with sorting grilles, formed by hinge-mounted and rotary-driven rollers, guiding templates positioned along the upper and lower arms of the conveyor, and a loading attachment. Productivity and sorting quality are increased by mounting the rollers on vertical supports and firmly fastening them to the links in the chain.

The guiding templates are placed on both sides of each conveyor arm and joined directly to the chain links. The templates are also interchangeable, with different radii of curvature to control the distance between the rollers. The fish are turned along the rollers by installing elastic brushes underneath the latter.

Raikov, N.N. Bul. 12/30.3.78. 12.11.75 as 189378 (4pp 29)

ZHIL/ ★ D12 13631B/07 ★SU-599-784

Fish centring and orienting conveyor for filleting machine - has magazines with troughs for head and undulating motion for final positioning

ZHILIN N I 09.11.76-SU-419586

(03.04.78) A22c-25/06

Transporter for fish, towards a filletting machine, comprises magazines with centering grippers for the heads, needle-like holders, and a base which can be given a rocking motion, plus a template. The reliability with which the fish are oriented is increased along the plane of the magazines, by providing each magazine with an inclined T-shaped trough for the head underneath the centering gripper, which is rigidly fastened to the bottom.

The template for actuating the bottom is wave-shaped. The rocking motion is enhanced by connecting the bottom and the channel at a given height of the latter, with the needle-like grippers, by means of a hinge in the form of a parallelogram.

Zhilin, N.I. Bul. 12/30.3.78. 9.11.76 as 419586 (3pp29)

FARE= ★ D12 13632B/07 ★SU-599-785

Fish decapitating equipment - with disc knives on each side of conveyor and electronic control circuits, to determine fish position and movement

FAR EAST POLY 16.10.75-SU-181612

(13.04.78) A22c-25/14

Device to cut the heads off fish as part of an automated and mechanised process, comprises a feeding conveyor, attachment to change the position of the fish with its own drive, disc knives, measuring mechanism, with control system connected to the disc knife, sensors and working unit. Decapitation of fish, which have not been oriented as they are placed in the trays can be done by adding an extra disc knife, sensor, working unit, terminal switch, control system for the working unit, and changeover relay.

The first group of contacts in the relay are connected to the outputs of both sensors; the second group of contacts to the terminal switches, and the third through the current source to the working units and the attachemnt which changes the position of the fish.

Sobchenko, V.V. Bul. 12/30.3.78. 16.10.75 as 181612 (4pp29)

UMEA= ★ D12 13633B/07 ★SU-599-786

Sausages heat treatment and smoking - by heating at 20-25 degrees C for 6-12 hours and treating with smoking preparation at 60-70 degrees C for 10-15 minutes

UKR MEAT DAIRY IND 22.12.76-SU-432805

(30.03.78) A23b-04/04

Heat-treatment of sausage-type articles, e.g. moist-smoking, involves settling curing while treating the surfaces with a smoke preparation, and drying. Product quality is improved and the process cycle is reduced by treating the sausage article, after settling, at 20-25°C. and relative humidity of air 65-75% for 6-12 hrs., until the temp. inside the sausages reaches 15-20°C.

This means that the surfaces are partially dried before treating with the smoke preparation. After smoking, the article is cooled in the drier to 2-4°C and a relative humidity of 85-95% for 12-24 hours. Treatment with the smoke preparation is done at 60-70°C. for 10-15 minutes.

Stacker-processor for papered food patties etc. - in which discharge end of conveyor belt is reciprocated horizontally in synchronism with arrival of patties
FORMAX INC 02.11.77-US-847703
Q35 (06.02.79) A22c-07 B65g-57

Food patties are placed on paper sheets and advanced on a belt conveyor. The patties pass beneath a station which pref. forms depressions in the upper surface of each patty. At its discharge end the conveyor belt is reciprocated horizontally in synchronism with the arrival of patties.

The reciprocation is achieved by a shuttle which includes the discharge roller of the conveyor and also an idler roller. The shuttle retracts rapidly to drop a patty from the end of the conveyor onto a stack formed beneath the conveyor. After a predetermined number of patties have been assembled the stack is removed.

The appts. processes the upper surface of a patty and then stacks it. The processing may comprise the application of a topping or the cutting of a pattern. Rapid action of the shuttle allows the patty to fall onto the stack with a dropping action which does not cause the patty to tilt. 2.11.77 as 847703 (8pp295)

Meat deboning process and machine - separates structurally intact meat pieces from bone gripped by power press plungers
LEVER BROTHERS CO 14.07.76-GB-029341
*(06.02.79) *BE-856-786 A22c-17*

To remove meat from bone, a portion of meat containing bone is compressed between movable plungers such that substantial pieces of meat move laterally relative to the remainder.

Compression continues until the bone is gripped between the plungers, the meat then being severed. The compressed mass, mostly bone, is then removed from the press. The meat moving laterally during compression is pref. collected in an annular chamber surrounding the press, and severing is pref. effected by movement between the press and the annular chamber.

The process is particularly suited to the primary stage of meat separation, in which it produces large pieces of bone-free meat of higher quality than hitherto attained. 14.7.77 as 815775 (4pp1379)

Growing seafood on land - by treating phytoplankton species in brackish or salt-water reservoir
PRYOR T A 29.09.76-US-727944
C03 P14 (06.02.79) A01k-61

Seafood is grown by passing brackish or salt water to an algal reservoir and then inoculating the reservoir with a number of phytoplankton species. Then adding organic animal manure and inorganic fertiliser to the reservoir, and then subjecting it to sunlight so that the phytoplankton density increases. The liq. is passed continuously to a prodn trench in which seafood is placed and it feeds on the phytoplankton.

Highly efficient system for growing seafood on land, esp. shellfish such as oysters, clams and lobsters, in commercial quantities is provided. Pollution and disease problems are avoided and loss due to predators, etc. does not occur. 29.9.76 as 727944 (15pp1248)

Deeply inlaid decoration of iced lollies with contrast material - projected at high pressure from nozzles set in required pattern

BRODRENE GRAM A/S 06.10.77-DK-004438

(01.02.79) A23g

The decoration comprises an inlaid design in material with a colour contrasting to the colour of the lolly. The decorative material is projected at high pressure from a set of nozzles arranged in the required design. Two sets of opposed nozzles are pref. employed simultaneously on opposite surfaces of a lolly.

Design projection is pref. carried out immediately after withdrawing a lolly from its freezer mould. Projection pressure at the nozzle is pref. between 50 and 1000 atmos. The mechanism is pref. fitted to a radial-armed, rotary machine for freezing lollies in rows on sticks suspended from each radial arm.

The projected material enters deeply into the lolly so the pattern remains as the lolly is consumed. There is no contact between the nozzles and the lolly, which is more hygenic than using injection needles. The projected material sets almost instantly so does not spread over the lolly surface. 6. 10. 78 as 871063 (14pp448)

Heat treatment of granular fruit seeds - with precise control of heating rate, temperature and duration (OE 15.9.78)

CESKE VYSOKE TECHN 12.04.77-OE-002519 (26.04.77-GB-017230)

*+P41 (14.02.79) *NL7704-170 B02b-05/02*

Starch-contg. edible substances such as cereal, pulses or oil-seeds are thermally treated by action of an electromagnetic oscillation as ultra-violet or infra-red radiation.

Substance is heated for 5-120 secs. from ambient temp. to 100-200°C; maintaining at raised temp. for 5-200 secs. and gradually increasing to ≯ 220°C and/or gradually decreasing to ≯60°C. Temp. change in first stage is by control of infra-red intensity or electromagnetic waves of wavelength 0. 7-0. 1 m and crushing or flocculating the substance when hot; then cooling down to <40°C. Temp. control in second stage is by maintenance of infrared radiation or electromagnetic waves or by an electric resistor heater and/or using thermal insulation of second stage.

Method is esp. useful to provide vegetable prods. as nutritionally-acceptable produce for human consumption, without wastage of raw material. 26. 4. 77 as 017230 (4pp931)

HAMP/ ★ D13 12519B/07 ★GB 2002-099

Drying moist fermented tea leaf - by hot air flow with portion of air flow being recycled

HAMPTON M G 12.07.78-GB-029616 (12.07.77-GB-029123)

Q76 (14.02.79) F26b-21/04

Tea is dried by directing primary drying air over it so that the air becomes laden with moisture. A wetter portion of the laden air is directly exhausted while at least a portion of the remaining laden air is redirected over the tea to be dried. The condition of the air flow over the tea is controlled.

Pref. the humidity of the laden air is monitored to control the condition of the air flow. This may be achieved by measuring the temp. of the laden air. If desired, primary drying air may be mixed with the redirected air in varying proportions depending on the measured humidity.

The method is used for drying tea during the mfr. of black leaf tea by drying moist fermented leaf known as dhool. The efficiency of the drier is improved cf. known devices. Additionally by selection of the appropriate proportion of gases to be recycled a higher level of desirable volatiles may be retained and thus an improvement in the quality of the final prod. is obtd. 12. 7. 78 as 029616 (10pp295)

Ink compsn. for jet printing on food, e.g. fruit or eggs - includes water soluble red dye in aq. alkali soln. contg. shellac binder and morpholine fatty acid salt

HITACHI KK 06.06.77-JA-065798

E24 G02 (06.01.79) C09d-11

An ink of pH 8. 0-10. 0 consists mainly of water-soluble dye and binder in alkali aq. soln. The dye is New Coccine (food red dye 102), Phloxine (food red dye 104) on Acid Red (food red dye 106). Shellac binder and morpholine fatty acid salt are also included.

The ink is excellent in adhesiveness and water resistance, and has excellent properties for food hygiene.

In an example, white lac aq. soln. (solid content 25% contg. 1% of morpholine fatty acid salt) 20 pts. wt., Phloxine 1 pt. wt., ethyl alcohol 50 pts. wt. and water 35 pts. wt. were mixed and stirred for 1 hr. at room temp., and filtered, obtaining an ink of viscosity 4 cps. pH 8. 5. 6. 6. 77 as 065798 (3pp50)

AJIN ★ D13 12938B/07 ★J5 4002-351
Starch-contg. heat-processed food prodn. - in which processed starch of specific swelling degree obtd. by gelatinising, drying and pulverising, is used
AJINOMOTO KK 07.06.77-JA-066959
(D17) (09.01.79) A23b-04 A23l-01/10 A23l-03

Method comprises using processed starch powder of swelling degree 3.0-6.0 singly or together with other starch as the starch component.

The processed starch is obtd. by heat-gelatinising starch, cooling it, drying it and pulverising it. Firstly water is added in an amt. of 30-60 (40-55)% on the solid starch and the mixt. is gelatinised at 70-150 (80-120)°C. To obt. the starch of proper swelling degree, the gelatinisation is practiced with stirring and it is desirable to use the extruder having small screw compressing ratio and to extrude the mixt. under relatively low pressure.

The heat-processed foods (e.g. pasty food, retort food, etc.) which can keep excellent properties on heat-processing and are excellent in taste and flavour, texture and preservative property, can be prepd. 7.6.77 as 066959 (7pp5)

IZAW/ ★ D13 12939B/07 ★J5 4002-354
Chinese noodles prepn. - from kneaded mixt. of flour with water contg. propylene glycol, saline water, sodium glutamate, salt and powder obtd. from e.g. beef
IZAWA Y 07.06.77-JA-067072
(09.01.79) A23l-01/16

Method comprises kneading powdery material consisting mainly of flour with water (I) contg. (a) 1-2% of dry powder obtd. by boiling oily meat or skin of chicken, pork, beef, etc., removing oil and fat from them and powdering, (b) 2-4% of propylene glycol, (c) 1-2% of saline water, (d) 0.2-0.3% of sodium glutamate and (e) 1-2% of common salt, rolling the obtd. dough and cutting it to form noodles.

Prepn. of steamed Chinese noodles comprises (1) steaming raw noodles for 2-3 mins., boiling for 1-2 mins., washing with water and removing water, (2) immersing the treated noodles in (I) for 20-30 seconds, (3) packaging the prod. in air-tight bags and steam-sterilising at 90-95°C for 20-30 mins. and (4) cooling with cold air under vibration.

Raw Chinese noodles and steamed Chinese noodles which are highly preservative and excellent in texture, taste and flavour can be obtd. By including propylene glycol in saline water the odour of saline water can be suppressed, the decomposition of vitamins can be suppressed and the antiseptic effect can be improved. 7.6.77 as 067072 (3pp5)

YOSH- ★ D13 12940B/07 ★J5 4002-358
Coagulating bean milk - by adding a small amt. of coagulant to low temp. bean milk, and adding this to the rest of the coagulant at a higher temp.
YOSHIKAWA SHOJI KK 02.06.77-JA-066166
(09.01.79) A23l-01/20

The method comprises using a rapidly effective coagulating agent, and comprises adding a small amt. of the coagulating agent to the bean milk which is kept at a low temp. such that the coagulation is suppressed; and mixing the cold bean milk with a large amt. of bean milk which is kept at a high temp. such that coagulation occurs.

The process gives bean curd which is palatable, soft, voluminous and has good water-holding property and texture, without using particular additives. Energy consumption is low. Pref. the coagulant is magnesium chloride, calcium chloride, calcium lactate, etc. Usually, 2.5-5% bean milk is previously cooled to <15°C and the coagulant is added in it, and it is added to the remaining bean milk at 65-95°C. 2.6.77 as 066166 (3pp5)

KOIK- ★ D13 12941B/07 ★J5 4002-360
Dried gourd shavings pickled in plum vinegar - have good colour and taste stability on storage
KOIKE SHOTEN KK 03.06.77-JA-064870
(09.01.79) A23b-07/10 A23l-01/21

Process comprises washing dried gourd shavings with water, boiling in water, immersing in mixed soln. contg. plum vinegar, sodium citrate, sugar, common salt, sodium glutamate, pigment and sorbic acid for a prescribed time to impregnate the soln. and to colour the shavings, and finally cutting the shavings.

The pickled prod. is bottled or packaged in bags and palatable food which can be preserved without change in colour and taste for long time, can be obtd. 3.6.77 as 064870 (2pp5)

NIGY ★ D13 12942B/07 ★J5 4002-36
Meat loaf-like smoked salmon prod. - prepd. by mixing mince smoked salmon, cod fish, shortening, soft cheese and sodiu caseinate, adding hard cheese, moulding and sterilising
NICHIRO GYOGO KK 23.12.76-JA-156015
(09.01.79) A23l-01/32

Process comprises kneading minced smoked salmon and minced codfish, adding shortening of m.pt. 30-40°C, sof cheese and sodium caseinate, kneading, adding fine piec of hard cheese, moulding and steam-sterilising.

The taste of smoked salmon and cheese are well matched. Smoked salmon is used in amt. 50-60% and minced codfish in amt. 10-20%. The minced codfish improves th texture of the prod. 23.12.76 as 156015 (2pp5)

TAIF ★ D13 12943B/07 ★J5 4002-36
Food having meat-like properties obtd. from fish - by impregnatin with pH-adjusting additives, standing and freezing
TAIYO FISHERY KK 08.06.77-JA-066777
(09.01.79) A23j-03 A23l-01/32

Method comprises cutting fish meat in pieces of 5-15 mm size, adding common salt 1.5-3.0 wt.% on fish meat, adjusting pH of the mixt. in the range of 6.8-7.3 with 0.15-0.25 wt.% on fish meat of sodium phosphate or sodium bicarbonate, mixing them so that meat pieces are not broken and the additives are impregnated well inside of meat pieces, standing them for structuring the reticular tissue and freeze-storing them at -3 to -25°C for longer than a day to freeze-modify the fish meat and to form animal meat-like texture.

Fish meat of low fat content or defatted fish meat (obtd. by defatting the fish meat of high fat content with slightly alkaline cold water) can be used. The fish meat pieces and additives are mixed at 5-25°C for 2-5 minutes The standing is effected at 15-40°C for 0.5-3 hrs. or at 3.15°C for 3-16 hrs. pref. in the presence of potassium bromate or calcium chloride.

Food material similar to animal meat in elasticity, touch, texture and taste and flavour, can be obtd. from fish meat. 8.6.77 as 066777 (5pp5)

ROKK- ★ D13 12945B/07 ★J5 4002-37
Soft cheese having excellent heat stability - prepd. by adding fuse salt and albumin to natural cheese, melting, emulsifying wit water, shaping and cooling
ROKKO BUTTER KK 06.06.77-JA-067168
(09.01.79) A23c-19/12

Process comprises adding 1-4 pts. wt. of >1 fused salt and 1-20 pts. wt. of albumin to 100 pts. wt. of natural cheese, heating, melting and emulsifying the mixt. with water so that the moisture content of the final prod. is 50-6 %, shaping and cooling.

The soft cheese is not melted at 60-150°C and can be directly mixed in pasty foods and heat-treated without melting.

Fused salt is e.g. sodium or potassium salt of polyphosphate, condensed phosphate, primary phosphate, secondary phosphate. The heat-melting and emulsifying is practiced at 70-90°C in an emulsifying pan and the cheese i sterilised. After melting, the cheese is degassed under reduced pressure. 6.6.77 as 067168 (3pp5)

SANE ★ D13 12947B/07 ★J5 4002-38
Sweetener contg. stevia - contains alkali metal salt of an organ acid as improving agent
SAN EI CHEM IND KK 01.06.77-JA-065180
B05 E17 (B03 E13) (09.01.79) A23l-01/22

The sweetener is obtd. by combining alkali metal salt of organic acid in stevia. The salts are applied in an amt. w/w% on stevia. Those salts and stevia may be added seperately in food or as the mixt. By combining those salts the sweetness of stevia can be improved to similar sweetness as that of sucrose and the good sweetness can be maintained even in acidic condition.

The alkali metal salts of organic acid partic. alkali metal salts of di-malic acid, acetic acid and d-tartaric acid are useful as the improving agent for the sweetness of stevia. 1.6.77 as 065180 (3pp5)

TEIJ ★ D13 12952B/07 ★J5 4002-399
Prepn. of dry bean paste for miso soup with slow sedimentation - by adding at least one of liq. or solid oil or fat, unsatd. fatty acid, fatty acid alcohol ester and fatty acid ascorbic acid ester
TEIJIN KK 02.06.77-JA-063960
(09.01.79) A23l-01/20

Method comprises adding 0.2-1.4 (pref. 0.4-1)% of >1 liq. and solid oil and fat, unsatd. fatty acid e.g. oleic acid, etc., higher fatty acid-higher alcohol ester e.g. bees wax, wood wax, etc. and higher fatty acid-ascorbic acid ester e.g. ascorbic acid ester of stearic acid, lauric acid, etc. to raw bean paste, mixing them homogeneously, drying the mixt. and powdering the dry mixt.

The liq. oily substances are added as they are and the solid oily substances are first pulverised to ca. 25 mesh and then mixed with the raw bean paste. They are mixed in a mixer and the mixt. is dried by e.g. freeze-drying, vacuum-drying, air-drying under low humidity, etc.

The dry bean paste can be made into 'miso' soup by adding hot water to it, and 'miso' soup obtd. is a stable dispersion which gives a slow sedimentation of a small amt. of bean paste. 2.6.77 as 063960 (4pp5)

SUEH- ★ D13 13113B/07 ★J5 4003-099
Dehydration of animal material - by mincing raw material and heating with fat and oils in cookers under reduced pressure
SUEHIRO TEKKOSHO KK 09.06.77-JA-068252
(11.01.79) C07g-07 C07g-17

Process comprises (a) mincing raw materials; (b) conveying to cookers through supply pumps; (c) heating them through fats and oils in the cookers under reduced pressure and thereby evaporating and dehydrating the water contained in the raw materials; and (d) discharging the dehydrated raw materials from the cookers through discharging pumps.

As the process is effected under reduced pressure, a heating temp. is low as <100°C can be used. As the raw materials do not come in contact with air in the dehydrating appts., the raw materials are not decomposed. Continuous method shows high heat efficiency and improves productivity. 9.6.77 as 068252 (3pp136)

Refining fatty oils - to give prods. of good colour, stability and low peroxide value
NIPPON OILS & FATS KK 10.06.77-JA-067843
(11.01.79) C11b-03

Fatty oil is contacted with (a), (b) or (c) below before acid sepg. process, in addn. to the ordinary refining process. (a) are cpds. having amino and carboxyl gps., e.g. aspartic acid, lysine, valine, methionine, cystine, alanine, phenylalanine, arginine, glutamic acid, leucine, glycine, serine, threonine, histidine, tryptophan, anthranilic acid, aminosalicyclic acid, aminophthalic acid, or HCl-, Na- or K-salt of these materials. (b) are cpds. having amino and sulpho gps., e.g. sulphamide, 4-sulphoanthranilic acid, 4-nitro-aniline-2-sulphonic acid 1-amino-2-naphthol-3,6-disulphonic acid, or Na- or K-salt of these materials. (c) are alkanolamines or their salts, e.g. monoethanolamine, diethanolamine, triethanolamine or HCl-salt of these materials.

Refined fatty oil having good hue and high stability (i.e. high preservability, low peroxide value) is obtd. 10.6.77 as 067843(4pp170)

KYOW ★ D13 13442B/07 ★J5 4004-766
Storable feedstuff for marine creatures - is kneaded with water and binder and coated onto substrate
KYOWA FERMENTATION KK 15.06.77-JA-069789
A97 C03 (13.01.79) A23k-01/20

Feedstuff for roll shell (Sic) and sea urchin is obtd. by kneading the feedstuff, digestable binder and water together coating the kneaded prod. onto a water-absorptive base material and then drying the resulting prod. The feedstuff can be stored for a long periods of time, has the high intake efficiency and prevents the pollution of water.

Antiseptics, fungicides, colouring agents and attractants can be added to increase the intake efficiency and to prevent the putrefication of the feedstuff. As feedstuff there are used fish meal, wheat flour, starch, algae powder, vitamin mix, mineral mix, bone powder, soy bean dregs, rice bran, wheat bran. As binder there are used arginate, cmc, gelatin, gum arabic, casein, PVA resin, agar powder, polysaccharide, protein, etc. As water-absorptive base material are used paper, cloth, unwoven textile, wood, clay plate and sponge. One or both sides of the base material can be coated. 15.6.77 as 069789 (5pp108)

ASAH- ★ D13 13443B/07 ★J5 4004-767
Feedstuff for racehorses - contains Spirulina algae which improves hair lustre
ASAHI CARBON KK 08.06.77-JA-067480
C03 (13.01.79) A23k-01/18

Spirulina algae is cultured by inoculating Spirulina algae into a culture liq. contg. nutrients and blowing in air contg. CO_2 while irradiating with light. As Spirulina algae there are used S platensis, S maxima, S major, S princeps, S laxissima, S sutilisima, S caldaria, S curta and S spirulissima. The Spirulina algae recovered from the culture liq. is washed with water and spray-dried at 130-160°C.

The Spifulina algae can be directly given to horses as granules or is mixed with a feedstuff and then given to horses. It is pref. mixed with a feedstuff contg. garlic. The amt. of Spirulina used is 4-12 (6-8)g, per 100 kg body weight, per day. 8.6.77 as 067480 (6pp108)

Silage and hay drilling sampler - with drill on end of column and contg. vessel into which sample passes after cutting

AGRIC AGROCHEM SERV 27.02.76-SU-328653

R16 (03.03.78) G01n-01/20

Sampler for silage and hay, using drilling techniques for cutting into the unbroken structure of storage piles, pits, trenches, silos, and other stores, comprises a drill bit, column pipe, intake vessel, and transfer attachment.

To extract samples of silage and hay without disturbing the structure or moisture content of the raw material at any depth of storage, and minimizing the driving-in force, the bit is made from wedge-shaped, diametrically-positioned cutters, with outer cutting edges. The latter are set at an angle of 10-15°. The external diameters of the bit and the intake vessel are equal.

High moisture butter mfr. from high fat cream - includes specified cooling and high pressure short-time treatment before extrusion to improve emulsion stability

PROVISION MACH RES 21.07.76-SU-390538

(03.05.78) A23c-15/02

Production of butter containing an increased amount of moisture, e.g. "Krestyanskii" ("Farmbutter"), primarily by obtd. high-fat cream, cooling it to a temp. at which there is a bulk crystallisation of the butter fat. This is treated mechanically, extruded and packed.

Product quality is increased, by carrying out the mechanical treatment at a pressure of 50-150 atm. with subsequent restructuring over 120-200 seconds.

Cream, with a fat content of 75% is cooled to 15-20°C. so that the butter fat crystallises out in bulk. This is subjected to mechanical processing by homogenising at a pressure of 50-150 atm. for a fraction of a second and subsequently restructuring over a period of 120-200 secs. The final mechanical processing consists in extruding and packing.

Darkened freeze dried coffee prodn. - using specific pressure during first part of drying then lowering pressure
GENERAL FOODS CORP 17.07.74-US-485854 (08.10.70-US-079340)
(06.02.79) A23f-01/04

A darkened freeze dried coffee is made by rapidly freezing a coffee extract. After the frozen extract has been ground it is dried in a vacuum chamber using a two phase pressure cycle.

During the first phase the pressure is at 400-500 micron Hg while in the second phase the pressure is lowered to below 300 micron Hg. The first phase lasts for 1-5 hrs. and comprises $1/4$-$\frac{1}{2}$ of the drying cycle. This process darkens the surface of the product without melting the frozen interior or allowing it to puff.

The process produces freeze dried coffee with a darker surface which resembles that of roasted ground coffee. 17.7.74 as 485854 (+3.12.73-US-421019)(3pp295)

Dehusking coconut by pushing past knives - arranged in two sets and opening as coconut passes
NATIONAL RES DEV CORP 07.08.75-GB-033039
(14.02.79) A23n-05/08

A coconut is dehusked by advancing it through a set of blades. The set comprises an upper pair of blades and a lower pair of blades which are initially parallel and aligned with the advancement axis of the nut. The blades make an initial longitudinal cut through the husk and the blades then separate to form wedges which prise the husk from the nut.

This sepn. of the blades is achieved by a combination of cams and gears which detect advancement of the coconut. Pref. a pair of guide blades is provides in a plane transverse to the initial plane of the cutting blades.

The appts. removes the husk from a coconut. 3.8.76 (17pp295)

Direct contact liq. carbon di:oxide cooling - with recovery of carbon di:oxide vapour for freezing foodstuffs in coolant reservoir contg carbon di:oxide slush

TYREE L 07.09.77-US-831227

Q75 (06.02.79) F25d-17/02

Material is cooled by direct contact with liq. CO_2 and the CO_2 vapour recovered by supplying liq. CO_2 to a cooling chamber contg. the material. The resulting contaminated CO_2 vapour is directed to a coolant reservoir in which CO vapour, liq. and solid CO_2 exist in equilibrium in the form of slush plus vapour.

In the reservoir the CO_2 vapour and any contaminants which liquefy above -69°F are condensed by melting solid CO_2. Clean CO_2 vapour and any noncondensables are withdrawn and the CO_2 vapour reliquefied and passed to a CO_2 storage vessel. Condensable contaminants are periodically removed by heating to a temp. at which they can be blown out of the system.

Used for freezing foodstuffs, esp. shrimp, beef, tuna, chicken and vegetables. A high percentage of CO_2 vapour is recovered for re-use. The process is esp. suitable fo combining with a pressure cooking arrangement to provid a system for cooking and freezing foodstuffs. 7.9.77 as 831227 (8pp67)

Sewage aerator cowl - resting on floats for uniform immersion conditions (NL 5.2.79)
PASSAVANTW MICHELBACHER 01.08.77-DT-734629
(08.02.79) B01f-03/04 C02c-01/10

A surface aerator for sewage is fitted with a cowl, the rim of which is drawn down to the liquid level. Floats ensure that the distance between the cowl rim and the surface level is kept constant under all circumstances.

This ensures that there is neither too much gap for harmful bacteria to be spread by aerosols nor too deep an immersion which affects the aeration efficiency. The new system can deal with all fluctuations of the sewage inflow. 1.8.77 as 734629 (16pp39)

RESN/ ★ D15 12211B/07 ★DT 2735-055
Thermoelectric breakdown of water - using electrolytic cell with DC supply in which the anode and cathode are sepd. by insulation shield
REZNIK S 03.08.77-DT-735055
E36 J03 (08.02.79) C25b-01/04

Water is decomposed into H_2 and O_2 by a thermoelectric process. The water conductivity is raised by the addition of an electrolyte and is located in a device having at least one anode and one cathode. These are separated by an insulating shield. They are subjected to a voltage of 15 to 1000V at a current density of 0.001 to 100 Amp/dm^2.

The anode and cathode are located at a spacing such that breakdown occurs with the above voltage and current density. The mixture so produced of O_2 and H_2 will contain some evaporated water and this is subsequently condensed out. The voltage and current bands can be narrowed down. The mixture so released is subsequently ignited and the thermal energy used.

Used for creating combustible fuel and purifying seawater. 3.8.77 as 735055 (14pp1053)

(05.01.79) C02b-01/14 C02c-05/02

Agent is prepd. by forming condensed benzene ringed cpd. with phosphoric acid gp. by the condensn. of an organic matter with reductive functional gps. and phosphoric acid under a steam pressure of ordinary to 30 and at a dry distn. temp. of 100-600°C and adding water to the cpd. obtd. The organic matter used includes wood sawdust, bamboo, straw, rice hulls, etc., having hydroxyl gp., aldehyde gp. carboxyl gp., ketone gp., etc., in their molecules.

The agent is effectively applicable to waste water discharged from organic cpd. - synthesising factories, e. g., for dyes, medecines, etc., dyeing processing factory, leather processing factory, plating factory, etc., contg. such heavy metals as hexavalent Cr, Cu, Hg, Cd, etc., exhibiting a great removal efficiency for various heavy metals, esp. for dichromate ion. 25. 5. 77 as 061438 (4pp117)

FUJD ★ D15 12606B/07 ★J5 4000-462
Purifying acidic aluminium-contg. waste water - by addn. of base and electrolysis to ppte. aluminium hydroxide
FUJIKURA CABLE WORKS KK 02.06.77-JA-065132
E33 J03 M11 (05.01.79) C02c-05/12

The acid aluminium-contg. waste water is first adjusted to pH 3-7 by the addition of a mixt. of NaOH and $Ca(OH)_2$, and then subjected to electrolysis to accelerate the coagulating pptn. of aluminium hydroxide while adjusting the pH to the neutral range.

The method can attain $>$ 95% clarification of treated water because the pptn. of aluminium hydroxide is accelerated and the generation of hydrogen gas upon electrolysis brings about the adjustment of pH to the neutral range at which nearly all aluminium ions are converted into aluminium hydroxide in a very settleable ppte. form. Water comes e. g. from aluminite electrolytic prodn. 2. 6. 77 as 065132 (5pp117)

MINS- ★ D15 12709B/07 ★J5 4001-270
Removal and recovery of hexavalent chromium from waste plating water - by electrolytic redn. to trivalent chromium which is pptd. as the hydroxide
MINSEI KAGAKU KENKY 07.06.77-JA-066335
E31 J01 M11 (08.01.79) C02c-05/12

The method comprises electrolytically reducing hexavalent Cr contained in the waste water to trivalent Cr with mild steel and carbon used as an anode and with stainless steel and mild steel used as a cathode, producing the trivalent Cr as the hydroxide, and thereafter aggregating the hydroxide with an aggregating agent.

In an example waste chromium plating water of 3. 3 pH contg. 320 PPM of hexavalent Cr and 20 PPM of trivalent Cr was adjusted with an aq. soln. of caustic soda to pH 6. The resulting soln. was electrolysed with voltage of 8 ± 1 V, current density of 1 ± 0. 5 A/dm^2, and for period of 10-30 minutes. As a result, removal rate of trivalent Cr was 70. 59-99. 99%.

Hexavalent Cr contained in the waste water can be removed in a short period, and the resulting treated water is harmless. 7. 6. 77 as 066335 (3pp51)

ISEK- ★ D15 12710B/07 ★J5 4001-271
Liq. sludge concentrator - has filter units immersed in sludge treating tank, in which vacuum filter suction and pressure reverse washing are performed
ISE KAGAKU KOGYO KK 06.06.77-JA-065723
J01 (08.01.79) B01d-31 B01j-01 C02c-03

Filter units are disposed in a sludge treating tank so as to be immersed in the sludge liquid contained in the tank, in which a vacuum filter suction and pressure reverse washing are alternately and continuously performed through suction pipes. Each filter unit comprises a filter pipe having small pores formed through the side wall and both ends closed, filtering membrane wound around the pipe, and suction pipe inserted into the filter pipe and connected to means for evacuating the latter pipe and for pressuring the liquid, through three-way cocks.

Sludge liquids are effectively concentrated in a simple structure at low cost. 6.6.77 as 065723 (4pp26)

TABU/ ★ D15 12711B/07 ★J5 4001-273

Sepn. of ferric ion from aq. phase by contact with hydrophobic liq. - contg. quat. ammonium salt followed by contact of hydrophobic liq. with second aq. phase

TABUSHI I 04.06.77-JA-065276

E31 (E16) (08.01.79) B01d-11/04 C01g-49/02

Method comprises contacting an aq. phase (I) contg. ferric ion coordinated with chlorine ion with hydrophobic liq. (II) contg. methyl trialkyl ammonium halide, and contacting (II) with aq. phase (III) without contacting (III) with (I).

The methyl trialkyl ammonium halide is pref. methyltrioctylammonium chloride, methyltrinonylammonium chloride, or methyltridecylammonium chloride. The hydrophobic liquid is pref. chloromethylene or chloroform. (III) pref. contains a ferric ion sepg. agent.

In an example an aq. phase contg. 0.05 mol./l. of ferric chloride, a chloroform hydrophobic liq. contg. 1.0 mol./l. of methyltrioctylammonium chloride, and an aq. phase contg. HCl at a pH of 2 were placed, in order, in a glass U tube. The hydrophobic liq. was stirred with a magnetic stirrer at 150 r.p.m., and ferric ion was extracted from the first aq. phase to the hydrophobic liq. and then extracted from the hydrophobic liq. to the second phase. 4.6.77 as 065276 (5pp51)

KURK ★ D15 12714B/07 ★J5 4001-278

Removing impurities from liq. using precoated filtration element - which is separately coated with anion and cation exchange resins

KURITA WATER IND KK 04.06.77-JA-065282

A91 J01 (08.01.79) B01j-01/08 C02c-05/08

In precoating a filtration element with a powdery ion exchange resin to obtain a precoated filtration element through which a liquor to be treated is passed to remove impurities, the improvement comprises seperately precoating the filtration element with a powdery cation exchange resin and a powdery anion exchange resin in any order to form double layers of the resins on the filtration element, and where a macro-molecular electrolyte is added to the resin or a fibre material is added to it.

In an example a slurry of a powdery cation exchange resin, a fibre material, and a macro-molecular electrolyte was provided on a filtration element to form a precoated layer of 2.5mm thickness. A slurry of a powdery anion exchange resin, a fibre material, and a macro-molecular electrolyte was supplied on the layer to form a precoated layer of 2.5mm thickness. Water contg. 500 ppb of $Fe_2O_3nH_2O$ was passed through the filtration element precoated with 2 layers to remove the Fe_2O_3. 4.6.77 as 065282 (3pp51)

NICA ★ D15 12719B/07 ★J5 4001-286

Flocculating agent used in waste water treatment - comprises water-soluble cyanamide-aldehyde polymerisation and condensn. prod.

NIPPON CARBIDE KOGY KK 07.06.77-JA-066269

A81 (08.01.79) B01d-21/ C02c-03 C02c-05/02*

A flocculating agent used for treatment of waste town water or waste industrial water, consists of a water soluble cyanamide-aldehyde polymerisation and condensn. reaction prod. of about 170-300 average mol. wt. The reaction prod. is obtd. by reacting 1 mol. of a cyanamide cpd. with > 2 mol. of an aldehyde cpd. in the presence of > 1 mol. of ammonium chloride per 1 mol. of the cyanamide cpd. The cyanamide cpd. is dicyandiamide, cyanamide, guanidine, or guanyl urea. The aldehyde cpd. is paraform acetoaldehyde, benzoldehyde, or furfural.

In an example 1071 g of 37% formalin was added to 504 g of dicyandiamide during stirring them. 321 g of ammonium chloride was gradually added thereto at 25-27°C for a period of 1.5 hrs. The resulting reaction soln. was heated to 85°C, reacted at that temp. for 4 hrs., and cooled to 65°C. to provide a soln. of a dicyandiamide-ammonium chloride-formaldehyde polymerisation and condensn. cpd. was obtd. 7.6.77 as 066269 (9pp51)

KAWJ ★ D15 12842B/07 ★J5 4001-955

Dechlorination of waste gas treatment liquor - by electrolysing the liquor to release chloride ions as chlorine gas, for use in sodium hypochlorite prodn.

KAWASAKI HEAVY IND KK 04.06.77-JA-066134

E36 J01 (09.01.79) C02c-05/12

In order to prevent corrosion caused by waste gas treatment liquor from equipment for flue gas desulphurisation etc., contg. large quantities of Mg ion and/or Ca ion and other metals, all or part of the used flue gas treatment liquor is passed to an electrolytic bath, in which dil. H_2SO_4 acid is added to the cathode side to regulate pH to < 4.0, for electrolysis without Mg ion, Ca ion, and other various metal ions being pretreated in a closed system.

Method is capable of not only preventing the formation of the hydroxide precipitates of metals but also discharging chloride ion in the form of chlorine gas in spite of the various metals present in large quantities, and enables one to produce sodium hypochlorite by absorbing the chlorine gas in NaOH soln. Thus, the method is applicable to the prevention of slime formation in the cooling water of steam power plants at the flue gas desulphurisation site and the treatment of factory effluents, and is applicable to both flue gas desulphurisation and denitrification processes. 4.6.77 as 066134 (4pp117)

KANA/ ★ D15 12843B/07 ★J5 4001-956

Removal of ammonia from water - by contact with treated sludge and electrolysis in presence of calcium fluoride to absorb ammonia into sludge

KANAI M 04.06.77-JA-066171

J03 (09.01.79) C02c-01/40 C02c-05/02

Method comprises subjecting nitrogenous organics-dominated sludge, e.g. sewage excess sludge, etc. to electrolysis in the presence of a fluoride to completely sterilise virus, bacteria, etc. present, and then adding dehydrated treated sludge to ammonia-contg. water in an amt. corresp. to 1-10 times the amt. of ammonia present, followed by approx. one hour of electrolysis at > 3 V and with DC of 30-50 mA in the presence of > 10mg of CaF_2. The ammonia is then adsorbed into the sludge.

This method gives the sludge a higher adsorption capacity because the fluoride-added electrolysis deprives the sludge of its bound water to form a surface of high interfacial adsorption capacity. The method also eliminates the offensive odours and colour of the nitrogenous sludges and so the treatment is beneficial from a health viewpoint. 4.6.77 as 066171 (2pp117)

SUMD ★ D15 12844B/07 ★J5 4001-957

Raw wool wash water treatment, with by/production of soil stabiliser - involves addn. of lime, carbon di:oxide, aluminium sulphate and high polymer coagulant

SUMITOMO CEMENT KK 07.06.77-JA-066329

C04 F06 (09.01.79) C02c-05 C05g-03/04

To clarify the wash water discharge in washing raw wool and also to effectively use the filter sludge, quick lime or slaked lime is first added to the wash water with stirring; a carbon dioxide gas-contg. gas is injected into the wash water; the calcium carbonate so formed is filtered off; aluminium sulphate is added to the filterate to form hydroxides followed by the addn. of high polymer coagulant; the hydroxides are filtered for removal; and then the filterated and supernatant are treated with a hypochlorite and the ppte. formed is filtered and then converted into dry powder by mixing with quick lime, which is used as soil stabiliser.

This method is capable of almost completely clarifying the wash water from raw wool washing operation with smaller scale treatment appts. and at lower cost, and in addn. can provide a soil stabiliser for agricultural use by effectively recycling the waste sludge.

The amt. of aluminium sulphate added is 3-5 vol.% of a 8% aluminium oxide-contg. aluminium sulphate soln. and the fine ppte. of aluminium hydroxide is formed at a pH 5.3-5.7. The amt. of hypochlorite, e.g. sodium hypochlorite, etc. is pref. 0.2-0.6 wt.% of available chlorine on the basis of the wt. of wash water to be treated. 7.6.7 as 066329 (4pp117)

SUMO ★ D15 12846B/07 ★J5 4001-959

Hexa:valent chromium recovery from waste water in fibre dyeing process - using acid mordant dyes, comprises contacting waste water with pyridine anionic exchange resin, eluting with alkaline soln. reusing eluate

SUMITOMO CHEMICAL KK (KOEI NIWO) 06.06.77-JA-067112

A91 E31 F06 (09.01.79) C02c-05/08 D06p-01/36

Hexavalent chromium (I)-contg. waste water is treated using a highly bridged salt type weak basic anionic exchange resin having a pyridine nucleus on either the main chain or side chains. (I) adsorbed in the anionic exchange resin is liberated by an alkaline soln., and then the (I)-contg. eluate is reused as it is or after treatment as the chroming agent in dyeing using acid mordant dyes.

The pyridine anionic exchange resin used is pref. obtd. from the homopolymerisation or the copolymerisation of vinyl pyridines, e.g., 4-vinyl pyridine, 2-vinyl pyridine, etc., and a cross linking agent, e.g., divinyl benzene, divinyl phthalate, etc., and the pref. resin is a gelled or macroporous sulphate type.

The method is capable of very effectively recovering (I) from the acid mordant dyeing waste water and also giving dyed substances comparable to those dyed with the new conventional chroming agent in hue and colour fastness. 6.6.77 as 067112 (6pp117)

MITQ ★ D15 12847B/07 ★J5 4001-964

Treating waste water contg. cyanogen complexes - by ozone treatment, first using predominantly UV light, then UV-deficient light

MITSUBISHI ELECTRIC CORP 03.06.77-JA-065988

(09.01.79) C02c-05/04

In the treatment of cyanogen complexes-contg. waste water by the combined use of light and ozone, appts. is used which is designed to pass waste water from one of two series-connected tanks, in which mainly UV light is used, to another reaction tank, in which UV-deficient light which predominantly has the wave length of the light absorption range of cyanogen complexes is used.

Method exhibits a great efficiency in the removal of cyanogen complexes present in great quantities in the waste water discharged from plating factories, photo developing factories, etc. by improving the utilisation efficiency of ozone and also by permitting the capacity of light source to be miniaturised. 3.6.77 as 065988 (3pp117)

Treating waste water contg. chromium - using the sodium chromate-diffusion step in sodium chromate prodn., for recovery of hexavalent chromium

NIPPON CHEM IND KK 09.06.77-JA-067277

E31 M11 (09.01.79) C02c-05/02

Treatment of waste water (I) contg. Cr. comprises the treatment of (I) in the sodium chromate-diffusion step in the eatment of (I) in the sodium chromate-diffusion step in the sodium chromate prodn. process, for recovery of 6-valent Cr and sepn. of the impurities, such as heavy metals and fluorine cpds. The impurities of heavy metal cpds. are pref. removed by pptn. as hydroxide and therefore the pH of (I) should be adjusted to > 6 in the sodium chromate-diffusion step.

for treatment of (I) exhausted from the processes for metal surface treatment, such as Cr metal plating process. The recovered Cr can be used as the raw material for the prodn. of sodium dichromate. The consumption of NaOH, slaked lime and other reagents is not necessary. The diffusion residue acts as filter aid in the filtration of the extract. 9.6.77 as 067277 (5pp42)

KUBI ★ D15 12891B/07 ★J5 4002-270

Appts. for heat-treating sludge from waste water treatment etc. - in which the sludge, steam and air are contacted in vertical column having partition plates

KUBOTA KK 07.06.77-JA-068110

(09.01.79) B01d-43 B01j-01 C02c-03

Appts. comprises a column having, at its bottom, an inlet port for sludge, an inlet port for steam, and an inlet port for air. The column contains vertically spaced partition walls defining transfer passages at alternating sides of the column, allowing the sludge to rise to the upper stage in the column.

Each partition wall includes spaced conical protrusions each having perforations in the conical wall through which the bubbles of steam and air are permitted to proceed to the upper stage.

The steam and gas introduced into the sludge at the bottom of the column contact the sludge and produce bubbles which rise vertically through the perforations of the partition wall to the upper stage. The sludge flows upwardly in a tortuous path and contacts with the bubbles as it passes over the partition walls across the width of the column. 7.6.77 as 068110 (3pp47)

MITU ★ D15 12896B/07 ★J5 4002-276

Membrane for use in ultrafiltration and reverse osmosis - comprises porous support, layer of alumina sol or alkali metal aluminate and layer of water soluble polymer

MITSUBISHI CHEM IND KK 08.06.77-JA-067476

A88 J01 (09.01.79) B01d-13

A dynamic membrane consists of (1) porous support, (2) layer of alumina sol. or alkali metal aluminate and (3) layer of water-soluble polymer. The membrane is prepd. by flowing aq. soln., alumina sol. or aluminate and aq. soln. of polymer on the surface of the support in a high pressure.

Specifically the support is made of ceramics, sintered metal powder, sintered glass powder, carbon and organic resins, e.g. cellulose acetate, PVC etc., and has pores of mean dia. of 0.01-1, e.g. (0.025-0.8). Sodium aluminate is pref. used as aluminite. The water soluble polymer is polyacrylic acid, polyvinyl pyridine, etc. 8.6.77 as 067476 (5pp42)

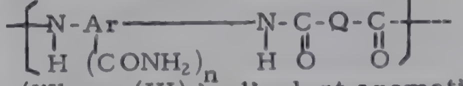
HITA ★ D15 12898B/07 ★J5 4002-279

Polyamide reverse osmosis membrane - has high mechanical strength and pressure resistance

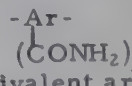
HITACHI KK 08.06.77-JA-066661

A88 J01 (A23) (09.01.79) B01d-13

The membrane (I) comprises polyamide (II) consisting of repeating units of formula



$$\left[-\underset{H}{N}-\underset{(CONH_2)_n}{Ar}-\underset{H}{N}-\underset{O}{\overset{\|}{C}}-Q-\underset{O}{\overset{\|}{C}}- \right] \quad (II)$$



$$-\underset{(CONH_2)_n}{Ar}- \quad (III)$$

(Where (III) is divalent aromatic gp.; Q is divalent aromatic or aliphatic gp.; and n = 1 or 2).

(I) is mfd. by coating a soln. contg. (II), solvent which can dissolve (II) and is water-miscible, and a soluble inorganic salt onto a support; evaporating a part of the solvent; forming a gelled membrane by soaking the support into water; and soaking the support into hot water. Pref, solvent is n-dimethyl formamide, n,n-diethyl formamide, n,n-dimethyl aceto amide, etc.; and the salt is LiCl, LiBr, $LiNO_3$, $CaCl_2$, etc. 8.6.77 as 066661 (8pp42)

TSUK/ ★ D15 12901B/07 ★J5 4002-282

Flocculant for use in waste water treatment - comprises magnetic iron oxide and anaerobic or aerobic bacteria, gives filtration cake of reduced moisture content

TSUKAMOTO K 08.06.77-JA-067628

E31 (D16) (09.01.79) B01d-21 C02c-05

The flocculant is composed of one of anaerobic bacteria, facultative anaerobic bacteria and aerobic bacteria, and magnetic iron oxide (II). Aluminium sulphate, polyaluminium chloride, high molecular polymer etc. may be fixed with (I). As (II), reverse-spinel ferrite, garnet-ferrite, γ-Fe_2O_3, Fe_3O_4 and other ferrite can be used.

When (I) is used as a flocculant in a thickener, the moisture content in the cake, exhausted after filtration of the sedimented mud, is lowered remarkably, by generation of biological heat over a long period of time.

In an example, 95g of Fe_3O_4 of 30 mesh and 30 gaus/g and 5g of facultative anaerobic bacteria was added to 20 l of waste water contg. 10 wt.% of solids and the cake recovered after sedimentation and filtration contained 40 wt.% of moisture. The cake recovered by the same procedures without the addition of (I) contained 80 wt.% moisture. 8.6.77 as 067628 (3pp42)

KOBM ★ D15 13062B/07 ★ J5 4002-979

Cleaning a membrane used in tubular reverse osmosis separator - ultrafiltration etc., using cleaning balls which are operated with collectors in feed and drain lines

KOBE STEEL KK 10.06.77-JA-069017
J01 (10.01.79) B01d-13 B01d-31

Two cleaning ball collectors are disposed in a feed and drain lines of the membrane separator. Each ball collector has an inlet and outlet, both provided with switching cocks; the first cock for connecting a feed line to one collector and drain line to the other collector, and second cock for connecting another feed line to the one collector and another drain line to the other collector. Both cocks are switched to reverse the direction of the soln. flow, only, to the collectors.

The membrane is cleaned by simple valve operation, with reduced pressured loss. 10.6.77 as 069017 (4pp26)

KOMI/ ★ D15 13203B/07 ★ J5 4003-358

Removing chlorine from domestic waste water - by adding L-ascorbic acid or L-cysteine or their salts

KOMINATO J 08.06.77-JA-068203
E16 (E13) (11.01.79) C02b-01/23

Chlorine is instantaneously and simply removed from town water by adding L-ascorbic acid, L-cysteine, one of their salts or glutethione opt. in the form of an aq. soln.

In an example, 20 g L-ascorbic acid is dissolved in 1 l. town water, after which 1-3 drops of the soln. obtd. is added to 120 ml. of town water so that free Cl_2 is removed. In a modification, 1 mg. of L-ascorbic acid may be directly added to the water as a solid. The function of this is that Cl_2 is converted by reduction to ionic form having no toxicity and intimate odour, using the cpds. described above. 8.6.77 as 068203 (2pp34)

SHIE ★ D15 13204B/07 ★ J5 4003-362

Mercury recovery from waste water - by adding oxidising agent e.g. hypochlorite and treating with ion exchange resin

SHINETSU CHEM IND KK 08.06.77-JA-066704
J01 M25 (11.01.79) C02c-05/08

Mercury recovered from waste water by (a) adding an oxidising agent, e.g. NaClO etc. to convert a very small amt. of metal Hg or organic Hg into inorganic Hg ion; and passing through an ion exchange resin having selective Hg adsorbability, e.g. having thiol radical as active radical to absorb therein.

The Hg-adsorbed ion exchange resin is treated with an eluting agent, e.g. conc. HCl soln, and alkali metal sulphide etc. to elute Hg; opt. pH adjustment of the Hg ion-contg. eluate is carried out. t is then subjected to electrolysing treatment or by adding a Hg-insolubilising agent (e.g. metal Al powder for amalgam formation) to recover the Hg ion in form of metal Hg or insol. Hg cpd.

pH adjustment is necessary in the recovery of Hg as a large amt. of $HgCl_4^{2-}$ and excess of HCl are contained in the eluate. 8.6.77 as 066704 (7pp34)

AGEN ★ D15 13205B/07 ★ J5 4003-363

Purificn. of emulsified effluent e.g. contg. cutting oil - by adding anion exchange resin and agitating to bring oil to surface for removal

AGENCY OF IND SCI TECH 08.06.77-JA-067605
A91 H07 J01 (11.01.79) C02c-05/02

An emulsified effluent, e.g. water-soluble cutting oil-contg. effluent etc. is purified easily and economically by adding an anion exchange resin, e.g. Diaion (RTH), Dowex (RTH) and Amberlite (RTH) etc. followed by agitation to destroy the emulsion and bring the oil components to the surface of the effluent for removal.

It becomes not necessary to carry-out dewatering of sludge; and the anion exchange resin (used as the treating material) is easily sepd. from the treated effluent. The regeneration or incineration of the adsorbing material is carried-out at lower cost etc.

In an example, 1 g. of a strongly basic II-type anion exchange resin (Diaion PA412) is added to 100 cc. of emulsified effluent contg. 0.01% of nonionic surfactant, polyoxyethylene nonylphenolether and 0.1% heavy oil (pH : 6.65), and agitated for 1 day at 25°C. The turnidity decrease was 96.0%. 8.6.77 as 067605 (3pp34)

JAGA ★ D15 13206B/07 ★ J5 4003-36

Sepn. of water from effluent contg. low boiling organic cpds. resulting from solidification of water-contg. radioactive io exchange resin discharged from nuclear power plant

JGC CORP 08.06.77-JA-068179
J01 K06 (11.01.79) C02c-05

Removal of lower boiling organic matters, e.g. amine cpds. (trimethylamine, dimethylamine etc.) and MeOH etc. from radioactive effluent resulting from the solidification of water-contg. radioactive ion exchange resin discharged from atomic power plant with asphalt, is claimed. Process comprises, (1) supplying aq. 5-30 wt.% H_2O_2 soln. in an amt. of 1-6 mols. per mol of organic matters at 10-60°C (for 0.5-2 hours) to convert the amine cpds. into higher boiling O-contg. N cpd., e.g. trimethylamineoxide and dimethylhydroxylamine etc. and to decompose MeOH into CO_2 and H_2O; and then (2) supplying th treated effluent to a distn. appts from which is obtd. fractionated water having high purity, i.e. distilled water containing none of the organic matters, which is suitable for reuse, e.g. in the atomic power station or for discharge into rivers without any pollution. 8.6.77 as 068179 (4pp34)

HITF ★ D15 13207B/07 ★ J5 4003-36

Biological treatment of night soil - by aerobic bacterial oxidn. nitrogen cpds., bacterial denitrification and recycling liquor oxidn. step

HITACHI SHIPBLD ENGG KK 09.06.77-JA-068445
(11.01.79) C02c-01/02

The night soil is treated by oxidising and transferring the oxidised night soil to a nitrification vessel where nitroge cpds. contained therein are oxidised to NO_2 and NO_3 with bacteria under aerobic state. The material is transferr to a denitrification vessel where NO_2 and NO_3 are reduce to N_2 with bacteria under anaerobic state. The improvement comprises recycling the nitrificated liquor to oxidising step, so that the amt. of NaOH (used as the neutralising agent) and the amt. of MeOH (used as the hydrogen donor) are reduced.

The amt. of diluting water is saved as crude night soi is diluted by circulation of the nitrificated liquor. This process is also applicable for the purification of nitroge contg. organic polluted waters. 9.6.77 is 068445 (3pp34

Treating organic waste liq. esp. contg. viscous polymeric materia by methane fermentation in presence of inorganic flocculant

MITSUBISHI HEAVY IND KK (AOHA-) 13.06.77-JA-068936
(D16) (12.01.79) C02c-01/14 C02c-03 C12d-03/10

Methane fermentation comprises adding inorganic flocculant to waste liq. at wt. ratio of 1/10^4 to 1/5x10^5, and fe mentation while maintaining a sludge concn. inside the methane fermentation vessel of 2000-8000 ppm and a rat of inorganic substance/organic substance in the sludge being flocculated at 0.01-0.5. The process improves methane-bacteria sludges as well as controls the concn of the sludges.

In an example methane fermentation was effected wit the use of waste soln. from canned prod. contg. 7000 ppm BOD and organic substance of 15000 ppm being add with 300 ppm $FeCl_3$ while changing the concn. of sludge the vessel from 1000 to 12000 ppm. 13.6.77 is 068936 (7pp43)

EBAI ★ D15 13287B/07 ★J5 4003-893

Refining of aq. soln. contg. high molecular material - using dialysis membrane, utilising difference in concn. and pressure to separate low molecular substances

EBARA INFILCO KK 11.06.77-JA-069324
A88 J01 (12.01.79) B01d-12 B01d-13 C08f-06/06 C08g-05

The method comprises (1) mixing the refined soln. obtd. in step (3) with the aq. soln. contg. high molecular and low molecular substances, (2) treating the mixed soln. with dialysing membrane under pressure so that the soln. contg. low molecular substances is passed through the membrane, (3) refining the filtrate by removing low molecular substances, and (4) applying the refined soln. for step (1) repeatedly.

Not only the difference in concn., but also the difference in pressure can be utilised as the driving force for separating low molecular substances. Thus the sepn. of low molecular substances can be effected without requiring large amt. of water. The dialysing-ultrafiltration membrane is composed of organic substance such as polyester, acetylcellulose, etc. or inorganic substance such as graphite. 11.6.77 as 069324 (3pp5)

Semipermeable sepn. membrane prodn. - by laminating two polymer films on carrier

MITSUBISHI RAYON KK 10.06.77-JA-069150
A88 J01 (D16) (12.01.79) B01d-13 B01d-31 B01d-53/22

Method comprises (1) impregnating or flowing a polymer soln. (A) on a carrier (e.g. porous sintered materials, textile, knitted material, non-woven cloth, paper, etc.), coagulating and drying to form a polymer-precoated carrier and (2) flowing a polymer soln. (B) on the precoated carrier to form a sepn. membrane by lamination.

Pref. the solubility parameter (S_1) of the polymer in polymer soln. (A) and that (S_2) of the polymer in polymer soln. (B) are such that S_1-S_2 is <4 and the polymer concn. of polymer soln. (A) is smaller than that of polymer soln. (B). The polymer is e.g. cellulose acetate, polyacrylonitrile, PVC, polyamide, aromatic polyamide, PMMA, polyester or polysulphone.

The resulting membrane is free from pinholes, cracks etc, has excellent water permeability and large mechanical strength. The membrane is useful for waste water treatment, in water prodn., pharmaceutical industry, food industry, and in the sepn. of bacteria, yeast, etc. 10.6.77 as 069150 (6pp50)

YOKO- ★ D15 13401B/07 ★J5 4004-457

Removal of e.g. arsenic and hydrogen sulphide from spring water - by adding ferrous ions and alkali to ppte. ferrous hydroxide and impurities and adding magnetic iron oxide dispersion and acid

YOKO YAKKA KOGYOSHO (NIES) 14.06.77-JA-070890
(13.01.79) C02b-01/23 C02c-05/02

Process comprises adding ferrous ion and alkali to form iron hydroxide with which As, H_2S and silicic acid, etc. are co-pptd., separately preparing a dispersion of black-magnetic iron oxide by subjecting a ferrous salt soln. to a magnetic oxide treatment; adding the dispersion obtd. to the iron hydroxide ppte. contg. water to adsorb the iron hydroxide (co-pptd. with As, H_2S and silicic acid etc.) on the magnetic iron oxide followed by settling and recovering; treating the recovered pptd. sludge with a mineral acid, e.g. HCl to carry-out the sepn. and the recovery of As, H_2S and silicic acid; and carrying-out the sepn. of the prodn. of ferrous chloride and magnetic iron oxide which are recycled to the treating steps, resp. so as to form closed system.

Harmful matters, e.g. As, H_2S etc. are easily removed in closed system from water, e.g. hot spring water (resulted in generation of electric power by geothermal heat) etc. without any generation of secondary pollution. 14.6.77 as 070890 (5pp34)

KUBI ★ D15 13402B/07 ★J5 4004-459

Bacterial treatment of polluted water - by nitrification of one portion under aeration and simultaneous denitrification of the rest and mixing together to control pH

KUBOTA KK 11.06.77-JA-069109
(13.01.79) C02c-01/02

Polluted water is subjected to economical nitrification and denitrification treatment without any use of pH-adjusting agent or organic carbon source, by introducing the polluted water to an adjusting vessel where it is diluted with H_2O and mixed with activated sludge containing BOD oxidising species, recycled from a final settling vessel.

The diluted water is admitted into a nitrification and denitrification vessel where it is sepd. into two streams, one of which passes under aeration through several nitrification zones, and the remainder passes through several denitrification zones; overflowing. A portion of liquor from the nitrification zones is overflowed into the denitrification zones over weirs provided on partition walls between the nitrification and denitrification zones to supply nitrite and nitrate necessitated in the denitrification zone and to neutralise the increased alkalinity of the denitrification liquor with the decreased alkalinity (lowered pH value) of the nitrification liquor.

The streams are mixed and sent to another identical vessel, and the liquor discharged therefrom is introduced into the settling vessel to separate it into a supernatant liquor (which is discharged) and a sludge, which is recycled. 11.6.77 as 069109 (3pp34)

KUBI ★ D15 13403B/07 ★J5 4004-460

Nitrification and denitrification of waste water - effected simultaneously using blower immersed in water in closed treatment vessel

KUBOTA KK 11.06.77-JA-069110
(13.01.79) C02c-01/02

Nitrification and denitrification of waste water are carried out simultaneously in single closed-type treating vessel equipped with blower immersed in water without any use of alkali and MeOH etc.

Process comprises (a) introducing the waste water into the treating vessel; (b) rotating a hollow axis while closing circulating gas-inlet valve (I) and opening outlet and inlet valves (II, III) to draw air into a partitioning tube, the upper part of which is fixed to the top of the vessel and closed, and the under part of which is open in water, the inhaled air being diffused in the air via inhaling holes in the hollow axis so as to make the water aerophilic, thus effecting the nitrification of NH_4-N and the oxidn. of BOD components;

Process further comprises (c) rotating the hollow axis while opening (I) and closing (II) and (III) to recirculate only the gas in the vessel via the valve without any new

supply of O_2, thereby effecting an aerobic denitirification; and (d) and repeating alternately the above procedures to effect nitrification and the denitrification alternately.
11.6.77 as 069110 (3pp34)

KUBI ★ D15 13404B/07 ★J5 4004-461
Nitrification and denitrification of polluted water in single vessel - by introducing into closed vessel contg. gas scattering pipes, aeration to oxidise nitrogen components etc.
KUBOTA KK 11.06.77-JA-069112
(13.01.79) C02c-01/02

Method comprises introducing polluted water to be treated (night soil etc.) into a completely closed treating vessel provided with of gas-scattering pipes at the inner underpart; a circulating gas-inhaling valve at the upperside wall; a pipe with which the valve and the inhaling side of a blower are connected together; a gas-passing pipe with which the exhaling side of the blower and each of the gas-scattering pipes are connected together; an exhausting valve and a pressure-adjusting valve at the upper part; an air-inhaling valve provided on the pipe. Aeration is carried out from the gas-scattering pipes by the blower on closing the circulating gas-inhaling valve and opening the air-inhaling valve and the exhausting valve in the case of the nitrification.

NH_4 -N in the water is converted by nitrification into NO_2-N and NO_3-N and BOD components are oxidised under aerobic state, and only the gas of the inside of the vessel is circulated via the valve, the blower and the gas-scattering pipes without any new supply of O_2 from the ouside on opening inlet valve and closing exhaust valves, so that NO_2-N and NO_3-N are converted by denitrification into N_2 under anaerobic state. The above cycle is repeated.

ISHI ★ D15 13405B/07 ★J5 4004-462
Biological denitrification of organic nitrogen contg. waste water - includes first stage of introduction, as carbon source, with sludge into vessel
ISHIKAWAJIMA-HARIMA HEAV 14.06.77-JA-069433
(13.01.79) C02c-01/02

Organic N-cong. waste water (I) is subjected to a biological nitrification and denitrification treatment without any addition of external organic carbon source and with relatively low alkali consumption while maintaining the flow-out of ammoniacal N and BOD components under low state (Sic).

(I) is first introduced into a BOD-adsorbing vessel together with a sludge under starvation, recovered from a settling vessel in the final step, where organic matter in (I) is taken by the sludge as the organic source, followed by sepg. into sludge and supernatent liquor in a settling vessel. The supernatent liquor in introduced into a BOD-oxidising nitrification vessel to which is also passed a sludge-contg. liquor from subsequent denitrification vessel, so that ammoniacal N is oxidised to NO_2-N or NO_3-N.

The BOD-adsorbed sludge sepd. in the 1st step is added to a sludge-contg. liquor from the nitrification vessel in the 2nd step, followed by introduction into a denitrification vessel where NO_2-N or NO_3-N is converted into N_2. Sludge-contg. liquor discharged from the denitrification vessel is recycled to the nitrification vessel to effect the oxidn. of NH_3-N and BOD components and to supply alkali components. Finally the remaining portion of the sludge-contg. liquor is introduced into the settling vessel where it is separated into a supernatent treated water and the sludge which is sepd. and recycled to the 1st step.

Metal and acid recovery from waste liquor - e.g. sulphuric acid and iron sulphate recovery after iron pickling

ASAHI GLASS KK 19.05.75-JA-058676

*J01 M12 (J03 M28) (20.01.79) *J51135-173 C02c-05/12 +C23g-01/36*

Metals and acids are recovered from waste liquor, e.g. waste liquor contg. H_2SO_4 and iron sulphate, discharged by the pickling of iron or a mixed soln. contg. H_2SO_4 and nickel sulphate, discharged from smelting of Cu.

The waste liquor is dialysed against water in a diffusion dialysing vessel equipped with an anion-exchange membrane. This recovers a portion of the acid. The waste liquor is then fed into a cathode chamber of a diaphragm electrolysing vessel, partitioned into a cathode and anode chambers with an anion-exchange membrane.

During electrolysis liquor is discharged from the cathode cahmber to the anode chamber, partitioned with a cation-exchange membrane. Hence metals are deposited onto the cathode of the diaphragm electrolysing vessel. Acid soln. is recovered from the anode chamber. The metals [illegible] almost completely recovered with high efficiency. 19.5.75 as 058676 C23g-1/36;C02c-5/12 (20.1.79) ASAHI GLASS KK (5pp)(J51135173)

Appts. for removing debris from rolling sewage - including tined scoop which carries debris to removal conveyor

BOLOGNA A 22.12.75-US-643379

(06.02.79) B01d-33/14

Sewage is treated in an appts. which includes a holding tank having an open top. Liq. sewage within the tank moves in a continuous roll-over current flow to promote aeration. A predetermined surface level is maintained in the tank.

A debris collecting device includes a conveyor and a rigid scoop which is positioned in the liq. sewage near its surface. The scoop has a pan portion and a tine portion. Sewage is continuously received in the pan which directs the flow to the tines. Debris in the sewage collects on the tines and is urged to progress along them by the force of the flow. The tines extend straight from the pan and then curve arcuately upwards. The debris is delivered from the arcuate ends of the tines to the conveyor which carries it to a station outside the tank.

Appts. is used to screen sewage to remove nonbiodegradable matter such as plastics and rags. The debris removing device is relatively simple and removes matter which otherwise might tend to clog pipes, etc. 22.12.75 as 643379 (6pp295)

*A32 J01 +P34 Q31 (A88) (06.02.79) *BE-868-006 +B29c-06/04 B29f-01/10*

A tube sheet is formed encapsulating fibres in linearly arranged continuous tow form. A tow of fibres is placed in a mould, a polymeric compsn. is flowed into the mould and between the fibres in a direction approx. perpendicular to the axis of the fibres until the mould and interstices are filled. The polymeric compsn. is caused to solidify at the axial ends of the mould while the compsn. continues to flow across the fibres. Solidifying polymeric material encapsulates the fibres to form the tubesheet which is then removed from the mould. The fibres may be hollow.

Process overcomes problems associated with impregnating pre-cut fibre bundles in alternative processes. The tubesheets may be used in reverse osmosis, ultrafiltration, dialysis, etc. 10. 6. 77 as 805602 (9pp1379)

Industrial aerobic fermentation - for mfr. of unicellular protein, in liq. gas contactor operating at gauge pressure above 2 bars

IMPERIAL CHEM INDS LTD 09.08.77-GB-033339 (09.08.77-GB-033338)

(D13) (07.02.79) B01j C12b

The contacting vessel is of the type which has a riser passage and a downflow passage with their upper ends joined into a common header chamber. Gas is injected continuously into liq. circulating continuously in the system. Gas is taken off continuously from the liq. and passes through the header chamber to exhaust. Gas above liq. in the chamber is held at ≮2 bars gauge pressure, pref. 3-10 bars.

Gas is pref. injected at the lower end of the vessel and the riser passage extends vertically for 40-80 metres. Exhaust gas from the chamber is pref. heated, e. g. to 100-1200°C, and used to power an expansion engine, e. g. a turbine. The engine is pref. used to drive a compressor which raises the pressure of feed gas to 3-10 bars gauge pressure.

Process is used for industrial prodn. of unicellular protein by aerobic fermentation of a culture of bacteria, esp. methylophilus methylotrophos in culture media contg. methanol as a source of carbon for growth. At pressures >2 bars the contacting efficiency is extremely high so that output from a given size of plant is much higher than at lower pressures. It is possible to produce a cellular mass of increased solids content, i. e. less liq. to be separated. Energy recuperation is achieved using exhaust gas to drive compressor. 7. 8. 78 as 869589 (20pp448)

KANEGAFUCHI KAGAKU 11.08.77-JA-096835

(12.02.79) C12b

The culture process at high concn. comprises removing the broth continuously or intermittently from the fermentor, then sepng. the yeast cells using a cell separator, or washing them additionally with water. The sepd. yeast cells are then fed back to the fermentor. The yeast is cultivated at a cell concn. of 6-20% on a dry basis, this concn. being the final concn. in the case of a discontinuous culture and the cell concn. in the case of a continuous culture.

Process is conducted in an appts. comprising a fermentor with perforated plates with multiple stages. The interior is subdivided by 1-10 perforated plates. It is connected at the top with a forced drawing off tube. Means are provided for recycling the culture broth, sepg. the yeast cells, aeration and for feeding carbon source and nutrients.

The sepn. removes yeast metabolites, salts etc. which prevents their accumulation resulting in growth inhibition. The multiplication of foreign microorganisms is suppressed resulting in improved growth as a very high quality product. 11. 8. 78 as 869684 (38pp597)

Autotrophic and mixotrophic culture - using submerged waterproof fluorescent lamps in vegetable suspension

BOHM H 23.12.75-DL-190393

(20.12.78) C12b-01/22

The autotrophic and mixotrophic culture of suspended vegetable organisms in a mineral nutrient soln. is promoted by photosynthesis. Waterproof sources of light are installed inside the tanks for a submerged illumination of the culture organism.

Large volumes of suspended organisms can thus be illuminated within a minimum of space. There is no limit to the layer thickness and opaque materials can be used to seperate the cultures from the environment. 23. 12. 75 as 190393 (6pp39)

BOHM/ ★ D16 12046B/07 ★DL -133-250

Alternate light and dark treatment of algae - with one fermenter and two dark containers for continuous prodn.

BOHM H 23.12.75-DL-190396

(20.12.78) C12b-01/22

In a process for the synchronous mass and laboratory-scale culture of algae by exposure to artificial light alternating with darkness a light fermenter is coupled to two dark containers. At the end of the exposure, cell suspension with parent cells is transferred from the fermenter in one of the containers for maturing and sporulation. The fermenter, which has been flushed with nutrient soln. and filled afresh, then receives from the second container the

autospores which have been released from the parent cells.
The light/dark alternation which is needed for the synchronous culture of single-celled algae can thus be realised and at the same time the fermenter can produce continuously biogenic mass by illumination. 23.12.75 as 190396 (7pp39)

BOHM/ ★ D16 12047B/07 ★DL-133-251
Adaptors permitting insertion of fluorescent lamps in liquids - formed by funnels sealed with self-hardening silicone rubber
BOHM H 23.12.75-DL-190398
A97 (20.12.78) C12b-01/22

The disadvantages of low tension, flourescent lamps when encapsulated for use in the illumination of liquids, that they occupy a much larger vol. in the liquid than the lamps themselves, that due to the distance between lamp and liq. light losses are considerable, and that an intensive illumination of fluids with encapsulated lamps is not possible. are eliminated.

Low tension fluorescent lamps of all types can be used in liquid media if their electrical contacts are enclosed in funnel-shaped caps of unbreakable glass or other suitable material and the joint between funnel and lamp and funnel and conductors is sealed by self-hardening silicone rubber or other suitable material for keeping out the liquid medium. 23.12.75 as 190398 (5pp1045)

Microencapsulation of labile biological material - using a diamine and a diacid halide in a two stage process
DAMON CORP 20.08.75-US-606166
*A97 B04 J04 +P33 (A23) (14.02.79) *BE-848-427 B01j-13/02*

Two-stage polymerisation

biological material inside a semipermeable membrane, comprises (1) prepg. an aq. phase of pH 5-9 contg. the biological material and a diamino monomer or a monomeric mixt. contg. a diamino monomer; (2) emulsifying the aq. phase in a hydrophobic solvent in which the monomer is slightly soluble to produce an aq. discontinuous phase.

Process further comprises (3) adding a dibasic organic acid halide to the emulsion to cause a 1st polymerisation reaction at the interface between the continuous hydrophobic solvent phase and the discontinuous emulsified phase droplets to form macroporous polymeric membranes which encapsulate the discontinuous phase droplets; (4) sepg. the macroporous capsules from the hydrophobic solvent to terminate the polymerisation; (5) resuspending the capsules in a liq. which has a lower solubility for the diamino monomer than the hydrophobic solvent; (6) adding the Znl portion of a dibasic organic acid halide to the suspn. to cause a 2nd polymerisation at the capsule membranes to strengthen the membranes and render them microporous yet impermeable to the biological material; and (7) quenching the reaction in suspension in the liq.

The materials such as enzymes or hemoglobin are encapsulated in bulk without direct competition with impurities for available binding sites. Thus highly active capsules can be made from relatively poorly purified materials. Also, the active materials are protected from attack by microorganisms often responsible for the inactivation, or inhibition of such reactor components. 24. 9. 76 as 039727 (12pp910)

Appts. for component concn. determn. in biological fluid - has two oxygen measuring cells sepd. by immobilised enzyme

PHILIPS GLOEILAMPEN NV 03.08.77-NL-008564

B04 J04 R16 (14.02.79) G01n-27/46

A device for the enzymatic determination of the concentration of a component in a biological fluid includes a quantity of immobilized enzyme which catalyses the oxidation of the component to be analysed. The device also includes two measuring cells for determining the oxygen concentration in the fluid. The first cell contacts the fluid on which the enzyme has not acted, whereas the second cell contacts the fluid on which the enzyme has acted.

The measuring cells are electrically connected in a circuit which measures the differece between their output currents. The immobilised enzyme is held in a reactor which is located between the two measuring cells so that the fluid flows from the first cell, through the reactor and then through the second cell.

The device is used to determine the concn. of a particular component, e.g. glucose, in a biological fluid, e.g. blood serum or urine, opt. mixed with a suitable buffer fluid. The device gives a reliable measurement. The reactor can be readily replaced so that the measurement of the concn. of different substances in rapid succession is possible. 31.7.78 as 031754 (4pp295)

The method to prepare edible vinegar through semi-continuous submerged fermenting method by aerating in the 'moromi' contg. alcohol, nutrients for acetic acid bacteria and seed vinegar, is characterised by controlling the total concn. (the sum of acidity and alcohol content) of the 'moromi' at the start of each fermenting cycle so that it is not higher than that of the preceding cycle by above 0.4 pref. by above 0.3 and in the case that the total concn. at the start of a cycle is higher than that of the preceding cycle by above 0.1 so that the total concn. in > 3 pref. 5 successive cycles is not higher than that of each preceding cycle by above 0.1 and thus taming the acetic acid bacteria to high acidity gradually.

Edible vinegar of high acidity partic. > 13% acidity can be prepd. stably. 9.6.77 as 067322 (7pp5)

RNA extraction from bacterium suspensions - using metal cations of valency at least two
MITSUBISHI GAS CHEM IND 10.06.77-JA-068469
B04 (11.01.79) C07g-17

Ribonucleic acid (RNA) is extracted selectively from bacterium suspension by heating in the presence of $>$2-valent metal cations in slight acid or slight alkaline conditions. The bacterium concns. of the bacterium suspensions are pref. $<$20 (5-15)%. Pref. metal cations (which improve the selective extraction of RNA) include, e.g. magnesium, calcium, cobalt, zinc, tin, barium ions, etc., esp. magnesium sulphate, magnesium chloride, calcium chloride, zinc sulphate.

RNA is extracted selectively at high extraction rates. After extraction of RNA, the residual bacteria are removed easily. 10.6.77 as 068469 (6pp136)

Wine maturing unit - has two tanks for heat treatment and cold holding connected to oxygen source and heat exchanger
UKR VINE GROWING 14.12.76-SU-429620
(20.04.78) C12g-01/02

The unit for maturing wine accelerates the process, and thus improves the product. It features a vertical tank for heat treatment and a tank for holding in cooled state, while its bottom is connected to the lower end of the heat treatment tank. The tops of the tanks are linked to oxygen feeder and to a heat exchanger.

The opening of the valves ensures that the tanks are filled with the wine material up to the lower level of the oxygen feeder. After closing the bottom valve, the heat exchanger is turned on for raising the temp. of the tank. As a result of heating, the expansion causes an overflow to the cool tank with the warm wine material passing the top heat exchanger as well as being saturated with oxygen before entering the top of the cool tank. Different types of wine material demand various periods for holding in heated and cooled states, the requirement met by mounting tanks with a ratio of volumes 1:1 to 1:5.

Selecting bacterial strains to produce poly:hydroxy-butyric acid - which is used to give mouldings etc. which are biodegradable

AGROFERM AG 06.08.76-CH-010104

*A35 E17 (A23) (06.02.79) *BE-857-493 C12d-01/02*

Selected bacterial strains are obtd. under any growth conditions which can convert an assimilable carbon source of carbohydrate, methanol, ethanol, glycerin, carbon dioxide or the spent lyes from caprolactam synthesis contg. mono- and di-carboxylic acid into poly-(D-3-hydroxybutyric acid). (I).

(I)-producing strains are selected by growth on agar nutrient medium, desired colonies adopting a milky-white appearance having a dome-shaped elevation above agar surface or attaining large dimensions. Strains are bred on constantly increasing concns. of carbon source and subjected at least once to mutagenic action to obtain desired strains. Pref. selection is made from strains having the lowest specific gravity under conditions hindering or not helping product synthesis, or from strains having the strongest colouring after brief flooding with Sudan black B soln.

Prod. is produced on large scale. Can be processed to mfr. structures and moulded bodies such as biodegradable threads, fibres and films. 8.8.77 as 822756 (7pp931)

TANA D16 04663A/03 =US 4138-292

Immobilised catalytically active enzyme or microorganism - enclosed in gel matrix of sulphonated polysaccharide contg. ions, amine or solvent

TANABE PHARMACEUTICAL KK 02.07.76-JA-079346

*A97 B04 (A11) (06.02.79) *DT2728-622 C07g-07/02 +C12b-01*

Immobilised catalytically active substance comprises an enzyme or microorganism or a water-insol., hydrophilic carrier bound enzyme or microorganism entrapped within the gel matrix of a sulphated polysaccharide (sulphate moiety content in the molecule being > 10 w/w %) contg. an ammonium ion, a metal ion of atomic wt. > 24, a water-soluble organic amine or a water-miscible organic solvent.

The compsn. shows a high level of catalytic activity for a long period of time. The gel matrix has sufficient stability to prevent enzyme or microorganism leakage and resists compacting or deformation. The sulphated polysaccharide is pref. carrageenan, furcelleran or a cellulose sulphate contg. 12.62 w/w% sulphate moiety. 16.6.77 as 807259 (19pp945)

CALY ★ D16 14085B/07 ★US 4138-383

Aq. emulsion polymerisation compsn. - for forming small polymeric beads useful for binding to proteins as labels etc.

CALIFORNIA INST OF TECHN 24.11.75-US-634935

A96 B04 (A18) (06.02.79) C08f-02/18 C08f-04/34

Aq. emulsion polymerisation compsn. contains 0.003-0.1 % free-radical catalyst, a surfactant and ⩽ 35% of an ethylenically unsatd. monomer mixt. The mixt. contains 25-50% water-soluble monoethylenically unsatd. monomer substd. by covalently bound COOH, NH_2 or OH; 5-20% polyunsatd. cross-linking agent, and 40-70% ⩾ 1 sparingly water-soluble, ethylenically unsatd., second monomer having hydrophobic characteristics.

Compsn. is used for forming a suspension of discrete polymeric beads of dia. < 3500 Å. The beads are small, round, biocompatible microspheres that can be covalently bound to proteins to label a specific receptor site on a cell membrane. Esp. useful in lectin, antibody and sugar derived forms.

Useful in the isolation of specific membrane fragments, or in biochemical mapping of a membrane to assess surface receptors that can redistribute in the plane of the membrane in response to a matrix contg. rigidly displayed ligands (useful for studying oncogenic transformation of cells). When tagged with fluorescent dye or radioactive molecules, the particles may be markers for assays, etc.

In an example, polymerisation of a mixt. of hydroxyethyl methacrylate, methacrylic acid, ethylene glycol dimethacrylate, Na dodecylsulphate and NH_4 persulphate at 98°C with agitation gave microspheres. 24.11.75 as 634935 (9pp1248)

D17: SUGAR; STARCH

STAL ★ D17 12381B/07 ★EP -----820
Large granule starch sepn. from native starch - by fractionation of starch slurry through several hydrocyclone separators and recycle of some streams
STALEY A E MFG CO 04.08.77-US-822013
G05 (21.02.79) C08b-31 C13l-01
D/S: BE, DT, FR, GB, LU, NL.

(A) A large granule starch prod. is obtd. from a native starch having a wide range particle size distribution by (i) preparing an aq. slurry of the native starch; (ii) feeding the slurry to a first hydrocyclone separator to separate the granules into a first slurry (I) contg. larger size granules and a second slurry (II) also contg. starch granules; (iii) feeding slurry (I) into a second hydrocyclone separator to separate it further into a large granule stream (Ia) and a recirculation stream (Ib) having a starch particle size distribution the same as the initial aq. feed slurry; (iv) adding stream (Ib) to the initial aq. feed slurry being fed to the first hydrocyclone; (v) supplying slurry (II) to a third hydrocyclone separator to separate it further into a by-prod. stream (IIa) and a recirculation stream (IIb) having a starch particle size distribution the same as the initial aq. feed slurry; (vi) feeding stream (IIb) to the initial aq. feed slurry being fed to the first hydrocyclone; and (vii) collecting the large granule stream (Ia) from the second hydrocyclone.

(B) The same method is claimed for obtaining a granular starch from a parent starch, the granular starch having a more uniform and limited particle size distribution than the parent starch.

The large granular starch is used as a protective material for pressure-sensitive microencapsulated coatings, e.g. in carbonless copy paper.

The yield of usable starch particles recovered from the starch can be improved to > 40%, compared with 15-20% by prior art methods.

Sepg. mannose from glucose and mannose contg. soln. - by passing through cation exchange resin then eluting
ICI AMERICAS INC 11.01.77-US-758397
*E13 (14.02.79) *BE-862-717 C13k-01/08 C13k-13*

Mannose is sepd. from an aq. soln. contg. glucose and mannose by contacting soln. with a bed of cation exchange resin in a salt form, and eluting resin with water to obtain mannose-rich eluate fraction.

Pref. cation exchange resin is strongly acid resin, in alkaline earth metal salt form esp. calcium. Solids content of aq. soln. contg. glucose and mannose is 10-70 wt. %. Glucose-rich fraction is recycled to an epimerisation reactor for further reaction to form mannose. Mannose-rich fraction may be further hydrogenated to form mannitol. Mannose is obtd. from ivory nut meal which has been hydrolysed.

Mannitol is used in the prepn. of pharmaceutical tablets in an economical process without associated production of sorbitol. 22.12.77 as 053452 (5pp931)

OKAM/ ★ D17 13327B/07 ★J5 4004-218
Desulphurising agent for molten pig iron or steel - comprising sugar slag from sugar refining and inorganic slag-forming, fluxing or refining cpds.
OKAMURA C 10.06.77-JA-076458
M24 (12.01.79) C21c-07/02

Agent comprises a main component of sugar slag derived from refining process and more than one of Mg, CaC_2, CaO, Na_2CO_3, $BaCO_3$, $CaCl_2$, $BaCl_2$, Na_3AlF_6, Al, Ca-Si, Si-Mn, Fe-Si and slag from their prodn. in amt. of <30 wt. %. Sugar content serves to shape the agent into powder or mass body. Agent is used at 0.5-30 Kg/ton of the molten pig iron or steel.

The sugar slag is a mixt. of lime for refining the sugar and carbon for decolouring and removing organic substances in the sugar, and consists of CaO 50-80%, C 5-30%, in addition to impurities of SiO_2 0-10%, MgO $<1.0\%$, Al_2O_3 + FeO $<1.0\%$, P+S $<0.07\%$ and K+Na $<1.0\%$. The sugar slag has a strong organic viscosity without using expensive caking agent. 10.6.77 as 076458 (4pp53)

Fructose prodn. from xerophyte plants - without need for cooking step

ZEPEDA-CASTILLO E 15.11.77-US-851657
E13 (06.02.79) C13c-01 C13d-03/02 C13k-11

Fructose and fructose-rich syrups are obtd. from xerophyte plants by washing mixed leaf and core material, chopping into small pieces, extracting with an aq. extractant at 95-92°C to produce an enriched soln., and expressing the remaining extractant from the solid plant material. The extracted juices are mixed and allowed to settle and clarify.

The liq. phase of the mixed juice is acidulated to pH 3-4, allowed to stand 2-3 hrs. at 85°C to its b.pt. then neutralised, filtered and clarified, then heated to 100°C, and finally conc. by evapn. and pasteurised to give a syrup from which at least part of the fructose is crystallised.

The process produces a juice from which the sugar can be crystallised and which is usable for a variety of purposes. The solid material left can be used for cellulose prodn. 15.11.77 as 851657 (7pp955)

NOVO D17 63094Y/36 =US 4138-290

Isomerising glucose to fructose on a bed of glucose isomerase - immobilised and in particle form with specified bed expansion

NOVO LABORATORIES 22.04.76-US-679445
*E13 (D16) (06.02.79) *BE-853-760 +C12d-13/02*

Expanded bed isomerisation is utilised to convert glucose syrup to a glucose-fructose mixt. contg. ≯ 40 wt. % fructose w.r.t. mixt. by passing a 30-55 wt. % glucose-syrup at isomerising temp. and pH up through > 1 bed of a ce mass particulate form glucose isomerase prepn.

Glucose isomerase prpn. has uniform particle size of 150-2,500 microns at superficial linear velocity for syru of 0.5-15 m/h. Velocity and particle size are inversely related to create a bed expansion of 5-100% and plug flow by the syrup through the bed. Bed depth is sufficient to achieve desired fructose end-product. Pref. life of bed is extended by intermittently or continuously adding fresh enzyme having activity > 100 IGIC units/g.

High fructose syrups are sweeter than glucose syrups and act as sucrose substitutes. Disadvantage of low density of cell mass particles is overcome to yield optimum enzyme activity. 22.4.76 as 679445 (5pp934)

Tobacco filter contg. fibrous activated carbon - prepd. by heating polyacrylonitrile, pitch or lignin type fibre in air and carbonising or treating with active gas
NIPPON CARBON KK 06.06.77-JA-065706
A88 J01 P15 (A35 A97) (06.01.79) A24b-15/02 A24f-13/06

Polyacrylonitrile fibre, pitch fibre, lignin-poval fibre, etc. are treated at 100-300°C in air to obtain high polymer precursor and carbonised in inert gas, or the high polymer precursor is treated for a short time at ~ 800°C in active atmos. e.g. HCl, Cl_2, SO_2, SO_3, etc. and then activated at 850-950°C and atmosphere of steam or carbonic acid gas. The fibrous activated carbon is used in a combination with acetate fibre bundle, plastics, foamed sheet, etc.

As fibrous activated carbon is 10-20 times larger in surface area per unit weight than fine powdery activated carbon, the rates of removing tar and nicotine are much larger and the fluctuation of the characteristics of the filter is little. Gas permeation resistance of the filter can be controlled to 1/2 to 1/6 time that of common acetate filter. 6.6.77 as 065706 (4pp50)

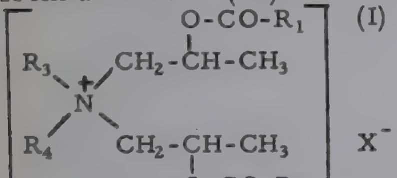
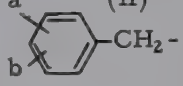
Bis-(2-acyloxypropyl)-ammonium salts of formula (I) (where R_1 and R_2 are each 15-21C alkyl(ene) gps. derived from a mixt. of (un)satd. fatty acids, R_3 is 1-4C alkyl or or a benzyl gp. of formula (II) (where a and b are each H or halogen). R_4 may be H, $-CH_2CH_2OH$, $-CH_2CH(OH)CH_3$ or R_3 and X is an anion) are claimed as finishing agents for textiles, paper and hair (opt. diluted).



(I)



(II)

They have outstanding cold resistance, have a lower vis-cosity than known products, are biodegradable and have a superior softening effect on textiles. 24.6.74 as 430140 (5pp922)

KAOS D21 21308W/13 =DS 2442-825

Toothpaste contg. anionic surfactants and sec. phosphates - to prevent formation of dextran deposits on teeth

KAO SOAP KK 14.09.73-JA-104192

*(08.02.79) *DT2442-825 A61k-07/24*

A toothpaste contains a combination of an anionic surfactant and a water-sol. sec. phosphate in which the former is an 8-22C carboxylic or sulph(on)ate having ⩾1 double bond in its hydrophobic gp.

Suitable surfactants include decenone acid, ricinolic acid, cis-9-hexadecenyl sulphate monoester salts (esp. Na/K) and suitable phosphates include Na_2HPO_4, K_2HPO_4.

This combination effectively removes dental plaque even where a toothpaste doesn't directly brush it away and helps to prevent its re-formation. 6. 9. 74 as 442825 (5pp922)

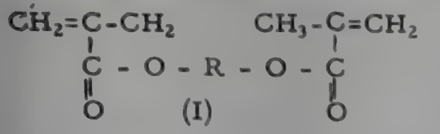
A96 P32 (A12) (24.01.79) A61c-09 C08f-02/02 C08f-20/30

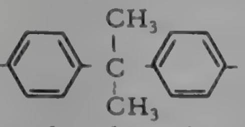
The polymer is polymer of monomer (I) or copolymer of

(I) and other vinyl monomer (II). In (I), R is  or



(I)

$CH_2{=}C(-CH_2)-C(=O)-O-R-O-C(=O)-C(-CH_3){=}CH_2$



(II) includes (m)ethyl methacrylate, butyl methacrylate, (m)ethyl acrylate, (meth)acrylic acid, vinyl acetate, acrylonitrile, etc. Amount of the vinyl monomer is ≤ 90 mole % relative to the total amount of the monomers.

The polymerisation is conducted in the presence of radical catalyst, ionic catalyst, or under irradiation of light at room temp. to 100 °C until monomer is completely polymerised. The resulting polymer shows high resistance to water and solvents, high abrasion resistance, high surface hardness, and high break point.

In an example, 4.0 pts. of bisphenol A-dimethacrylate is place in a polymerisation vessel, air is replaced with nitrogen and then heated at 70 °C for 1 hr. 85 °C for 1 hr. and further 100 °C for 1 hr. followed by curing at 120 °C for 1 hr. When the resulting transparent polymer is immersed in boiling water, cracks and turbidity are not observed even after 5 hrs. 8.3.69 as 017197 A61c-9/00; C08f-20/30, 2/02 (24.1.79) TOKYO IKASHIKA DAIGAKU-CHO (4pp22)

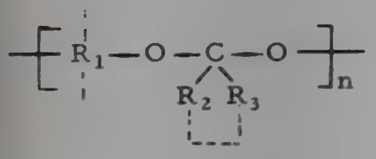
Biodegradable ortho-ester polymers - for enclosing active agents to be liberated therefrom e.g. steroid implants

ALZA CORP 28.01.75-US-544808 (24.08.77-US-827223)

*A96 B07 C03 +P34 (A23) (06.02.79) *BE-837-935 C09k-03*

New orthoester and orthocarbonate polymers are provided comprising a repeating unit (I) of hydrocarbon radicals and a symmetrical dioxycarbon unit with a wide range of organic gps. bonded to it. In the formula R_1 is di, tri or tetravalent hydrocarbon radical; R_2 and R_3 are hydrocarbon radicals or R_1O with R_1 being divalent and at least one of R_2 and R_3 being linked to the dioxycarbon through O, e.g. in alkoxy gp.



(I)

The polymers are prepd. by contacting a polyol monomer with an orthoester or orthocarbonate monomer. They have a controlled degree of hydropholucity and erosion in aq. or similar environment and may be manufactured into devices and coatings for releasing drugs, fertilisers, etc. at a controlled rate. The polymers erode to harmless prods. 24.8.77 as 827223 (21pp1392)

Long-acting plaque-dispersing enzymes - prepd. by binding the enzyme to a carrier with ethyl chloroformate, etc. as complexing reagent

US SEC OF NAVY 03.08.77-US-821275

B04 (D16) (06.02.79) A61k-07/28

A technique for degrading plaque on the surfaces of teeth is as follows: (a) a plaque-dispersing enzyme (I) is bonded to a carrier (affinity for tooth surfaces greater than (I) by treatment with a complexing reagent to form a modified enzyme (II) with a greater affinity for tooth surfaces than (I); (b) (II) is introduced into the mouth to contact the teeth.

Suitable (I) include the known dextranase, glucanohydrolases which may be used to degrade α-1,3- and α-1,6- glucosidic links, polysaccharidases for degrading polysaccharides, and proteases (opt. in combination with dextranase). Carrier is suitably a phosphoprotein (phosvitin) or phosphoserine, etc. (I) may be bonded to the carrier using glutaraldehyde, $ClCO_2Et$, or hexamethylene diisocyanate, etc. as the complexing reagent.

(II) has the plaque-dispersing activity of (I), but has considerably enhanced binding affinity for teeth. Thus (I) are highly effective for the control and treatment of dental caries and periodontal diseases, and are also effective for prolonged periods of time. 3.8.77 as 821275 (6pp478)

P34 (D15) (08.02.79) A23l-03/28 A61l-01 A61l-03 B01j-01/10 C02b-03/02

In a system the sterilisation and disinfection of fluid media by irradiation with ultra-violet rays of 240-320nm wavelength, the photoreactor is subdivided into several chambers through which the medium flows in turn at right angles to the direction of rays. A specified part of the radiation entering into the chamber directly adjacent to the source of radiation continues into the next chamber.

This results in more homogeneous irradiation and in a better utilisation of the ultra-violet radiation energy. 6.8.77 as 735550 (96pp39)

AMIN- ★ D22 12259B/07 ★DT 2831-360
Heparinisation of charged surfaces - using oppositely charged colloidal solutions of complex of heparin with surfactant
AMINKEMI AB 18.07.77-SW-008296
B07 P34 (08.02.79) A61m-01

In the heparinising of a charged surface of a medicinal product, the charged surface is treated with a fine-particle colloidal aqueous solution of a complex cpd. of heparin and a cationic surface active substance, the charges bound to the surface of the colloidal particles being of opposite polarity to those bound to the charged surface of the medicinal product.

New agents for carrying out the above procedure consist of a fine-particle colloidal aq. soln. of a complex cpd. of heparin and a cationic surfactant, charges of positive or negative polarity being bound to the surface of the colloidal particles. The colloidal soln. contains 1-100 IU heparin per ml, the amount of surfactant being such that the light transmission of the soln. (at 400 nm with an optical path of 1 cm) is $>$ ca 40% of that of pure water when the heparin concn. is 50 IU/ml an $>$ ca 90% of that of pure water when the heparin concn. is 10 IU/ml.

Used for prevention of platelet adhesion and thrombus formation when blood is in contact with medicinal products such as catheters, blood oxygenators, artificial heart valves, blood bags, etc. The method gives good and reproducible coating of a wide range of surfaces with heparin, without having to use organic solvents. 17.7.78 as 831360 (34pp280)

Charge absorbing, insulating casing for regenerating type air purifier - which enables generated ozone molecules to become positively charged and recombine with negatively charged molecules

BRUNDBJERG N 04.08.77-DK-003499

P34 (21.02.79) A61l-09

D/S: BE, CH, DT, FR, GB, LU, NL, SW.

A regenerating type air purifier includes a radiating device such as a mercury lamp which is surrounded by a charge absorbing, non-conductive casing. The material of the casing may be a soft, optionally plumbiferous plastic. The air flows through an electric field in an electron-cloud forming member which is capacitor-like. Both the radiating device and the electron-cloud forming member are actuated by a voltage multiplier connected to the mains.

The air purifier is particularly useful for aircraft , automobiles and hospitals. It can also be used industrially (e.g. in slaughterhouses) or in office environments.

The purifier does not require ventilating ducts to the surroundings and is therefore easy to mount. There are no thermal losses and the oxygen content in a room is increased no more than 6-8%. It is inexpensive to produce. The keeping quality of meat is increased in slaughterhouse usage since only viruses and bacteria are killed. 27.7.78 as 100517 (8pp1044)

J01 P34 (08.01.79) A61l-09/ B01d-53/34*

An adsorbing column has an adsorbant feeder and drainer, which are connected to an adsorbant drainer and adsorbant regenerator drainer, respectively, through closed conveyors, thus forming closed system for the adsorbant.

The adsorbant fed into the column through one of the conveyors adsorbs malodourous components of the exhaust gas fed into the column. The adsorbant is then fed into the regenerator, before being returned to the column. 6.6.77 as 066869 (3pp26)

KUBI ★ D22 12840B/07 ★J5 4001-920
Building material for external use - comprising inorganic materials to which a copper ion source has been added, preventing mould growth
KUBOTA KK 07.06.77-JA-067700
C03 E32 L02 Q44 Q45 (09.01.79) E04c-02/28 E04d-01/22

A building material, intended for use in outer walls, roofs, etc. in particular, is mfd. by adding a copper ion-forming agent to an inorganic material, e.g. Portland cement, calcium silicate or gypsum.

Material is treated so as to prevent blackening of the wall surface, etc. due to the growth of Aspergillus niger (black mold) by the addition of a copper ion-forming agent, and has a stable, strong antibacterial performance for a long length of time, thus assuring a long-term unchanging appearance. In particular, in the case of the building material coated with a plastic paint etc., addn. of the copper ion-forming agent results in high adhesion of plastic coat because no bacteria grow between the plastic coat and the building material. 7.6.77 as 067700 (3pp117)

Appts. for deodorisation by ozone - includes ozone generator, mixer, oxidn. reactor packed with catalyst and ozone flow rate control device
TOKYO SHIBAURA ELEC LTD 08.06.77-JA-066735
E36 J01 (09.01.79) B01d-53/34 B01j-01/14

The appts. is equipped with (1) ozone generator, (2) a mixer for mixing ozone and the gas to be deodorised, (3) an oxidn. reactor packed with catalyst for oxidn. of odourous cpds. (4) device for control of the amt. of ozone to be fed into the cpds. according to a signal, which is made in proportion to the concn. of odourous cpds. in the gas treated.

The amt. of ozone used can be economised and the lifetime of catalyst can be prolonged. For example, in the treatment of faeces and urine, the concn. of odourous cpd. in the generated gas is the highest at the start of agitation and decreases gradually. The amt. of ozone consumed can be controlled in the proportion to the amt. of cpds. to be treated in the gas. The catalyst is e.g. active carbon. 8.6.77 as 066735 (3pp42)

Disinfector for clothing, footwear etc. - has electrically heated chamber with steam generator and formaldehyde evaporator and spongy porous material lining
TAKHISTOV V A 15.09.75-SU-171784
P34 (07.04.78) A61l-03

Electrical disinfector, for use in medical engineering, for taking the infection out of clothing, footwear, etc., consists of a body with a lining made from sheet material, and a steam generator inside the body. The generator is a closed chamber with steam outlet pipes. A formalin evaporator is positioned in the top part of the chamber and consists of an open container, and an electric heater mounted underneath the steam generator.

The destructive effects of high temp. are avoided by bending the steam outlet pipes and fixing them in such a way that their exit ends are located at the bottom of the evaporator. The inner surfaces of the body are fastened to layers of spongy or porous materials, e.g. polystyrene foam.

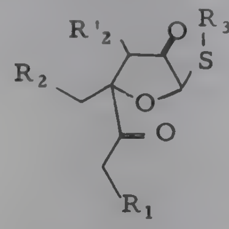
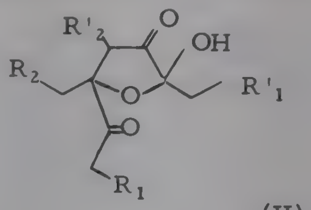
*B07 E13 +P15 (B03 D13 D18) (06.02.79) *US4092-333 C07d-307/32*

Prepn. of 2-acyl-5-substd. thiatetrahydrofuran-4-one cpds. of structure (I) comprises (i) dimerising in the presence of base, a 4-6C α,β-diketone R_{11}-CH_2-C(O)-C(O)-CH_2-R_{12} to form an α,β-diketone dimer of structure (II);



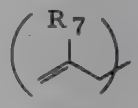
(I)



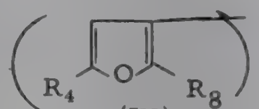
(II)

then (ii) reacting the dimer with mercaptan, R_3SH in the presence of an acid catalyst.

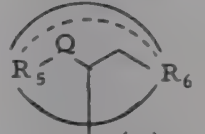
In the formulae, R_1, R_2R_1' and R_2' are H or methyl, R_3 is 1-9C alkyl, benzyl, phenyl, (un)substd. allyl of structure (III); (un)substd. 3-furyl of structure (IV); oxy



(III)



(IV)



(V)

or hydro alkyl of structure (V). Q is > C=O or > C-OH. R_5 and R_6 are lower alkyl or together complete a cycloalkyl ring. R_4, R_7 and R_8 are H or methyl. R_{11} and R_{12} are H or methyl provided that the total number of moles of methyl gps. and H gps. constituting R_{11} and R_{12} is equiv. to the total number of moles of methyl gps. and H gps. constituting R_1, R_2, R'_1 and R'_2.

The new cpds. are used in enhance or modify the flavour and aroma of foods, tobacco, medicines, perfumes, etc. Coffee, roasted almond, liquorice or caramel notes may be provided. US 4092333 claimed the cpds. per se. 17.3.78 as 887631 Div. ex. 4092333 (11pp945)

Allergen-free lanolin wax - produced by adsorbing lanolin on an adsorbent and eluting with a non-polar solvent and used in pharmaceutical and cosmetic compsns.

DAI-ICHI CRODA CHEM (DAII-) 28.09.76-JA-117034

*B07 (D21) (06.02.79) *DT2743-674 +C07j-09*

Non-allergenic lanolin, free from skin irritants, is obtd. by fractionating woolgrease or lanolin into non-polar lanolin wax (I) and polar lanolin wax (II). A soln. of woolgrease or lanolin in non-polar solvent (III) is passed through a column of an adsorption medium (IV) for free fatty alcohols. The passed soln. is evaporated to obtain (I) whilst (II) is recovered by eluting the column with polar solvent, e.g. CH_3OH and evaporating the elute.

(III) is e.g. n-hexane, $CHCl_3$; (IV) is e.g. activated clay with particle size 16-200 (30-200) mesh. (I) is substantially odour and colour-free, with total free fatty alcohol content ≤ 1.7% and 1,2 diol content ≤ 0.26%, and has wide applications in cosmetics and pharmaceuticals. (II) has uses in industry due to improved hydrating, emulsifying, plasticising and lubricating properties. 26.9.77 as 836794 (5pp1392)

FARH ★ D25 11931B/07 ★BE -869-719
Detergent additive contg. sodium sulphate and/or tri:poly:phosphate - which is used as a powder sprayed with specified phosphoric acid ester
HOECHST AG 19.08.77-DT-737409
A97 E11 (E34) (12.02.79) C11d

The granular free-flowing powder contains (a) a primary, secondary or tetiary orthophosphoric acid ester, in which the alcohol constituent is a 1-24C aliphatic alcohol, the reaction prod. of a fatty alcohol with 2-3 mols. ethylene oxide, phenol, or the reaction prod. of a 7-20C mono-, di, or trialkylphenol with 4-20 mols ethylene oxide and (b) powdered anhydrous sodium sulphate and/or sodium tripolyphosphate having a max. apparent density of 500 g/l.

The ratio of (a):(b) is 0.5-1:1 and (a), liquid or molten, is applied by spraying to the surface of the particles of (b) The prod. is used at 0.1-50% in an organic surfactant detergent prod.

Used esp. in washing powders, the prod. is stable to storage, is easier to prepare than previous prods. contg. the phosphoric acid esters and the prepn. provides a satisfactory method of incorporating the often waxy or pasty esters. 11.8.78 as 869719 (9pp597)

Granular oleyl methyl tauride, useful as surfactant - prepd. by direct reaction of oleyl chloride and N methyl tauride
VEB LEUNA-WERK W ULBRICH 10.10.77-DL-201417
E16 F06 (20.12.78) C07c-143/15

A process for the continuous prodn. of granular oleylmethyltauride (I) by reacting oleyl chloride and N-methyltauride in the presence of an acid binding agent. In a first stage, the reactants are reacted at 60-120°C and 10-120 atmos. for 10-60 sec. In a second stage, the reaction prod. is released to 50-70°C and 250 Torr to dehydrate it. In a third stage, the prod. is raised to 90-120°C and 10-110 atmos. and finally released through a perforated plate.

The prodn. are useful as surface active agents, e.g. in the textile industry as cleaning, wetting and dispersing agents, dyeing aids, etc. and as components in body care agents. Compared with prior art agents of this type, the present material have little ballast substance content and a high apparent density (0.6 g/cm^3), giving good keeping properties and improved transport properties. 10.10.77 as 201417 (7pp513)

JOHN/ ★ D25 12453B/07 ★GB 1540-386
Water-based cleansing and degreasing compsns. - contg. water-in-oil emulsifier together with high HLB surfactant, useful for skin cleaning etc.
JOHN W H T 15.11.75-GB-047150
E19 (14.02.79) C11d-01

Aq.-based surface active compsns. for use as cleaning or degreasing agents consists of a mixt. of a surfactant (I) of HLB $\ngtr$ 6, and another surfactant (II) of HLB $>$ 6. The amts. of (I) and (II) are such that the HLB of the mixt. is high enough for the mixt. to have detergent properties.

Compsn. is effective in removing unwanted dirt and grease from objects, but does not leave the treated surface completely oil-free. Compsn. is thus useful for cleaning ferrous metal surfaces (and preventing subsequent rusting) etc. In partic., however, the compsn. is useful for cleaning hands, and esp. after repeated use the hands do not roughen or chap, and the texture and appearance of the skin may even improve.

Suitable (I) include mono- and diglycerides of long chain fatty acids; sugar fatty acid esters; polyoxyethylene alcohols. Suitable (II) include nonionics (esters of $\nless$ 8C pref. 12-20C fatty acids with sugars, opt. further substd. with polyethers; polyoxyalkylene acids, alcohols and their adducts, such as fatty glycerides), and cationics (substd. NH_4 cpds.,) but are esp. anionic surfactants (fatty alcohol hydrogen sulphates or alkyl aryl sulphonates both usually as Na salts; or esters formed by addn. of H_2SO_4 to the double bond of olefins of mol. wt. $\nless$ 140). 15.11.76 (5pp478)

ICIL D25 79357X/43 =GB 1540-719
Emulsifiers decomposing on change of acidity in aq. emulsions - for removing mineral or vegetable oils from surfaces, and for use in metal-working oils
IMPERIAL CHEM INDS LTD 12.02.76-GB-005610 (07.04.75-GB-014143)
*E19 M12 +P43 (14.02.79) *BE-840-485 B01f-17/18 C10m-01/06 C11d-07/50*

Emulsion comprises water, a water-immiscible liquid and an emulsifying agent (I) which is decomposable by alteration of the pH of the emulsion and has formula $R_1R_2R_3N^+(CH_2)_mCOO[CH_2CH(Y)O]_nR_4\ X^-$. In the formula, R_1, R_2 and R_3 are each opt. substd. alkyl or alkenyl of 1-4C or H; or one of R_{1-3} may also be cyclohexyl or benzyl; or R_1 and R_2 together with the N may form a ring contg. 4-5C atoms and opt. a further heteroatom.

R_4 is a 1-30C hydrocarbon gp. X^- is an anion. Y is H or methyl; m is 1 or 2; n is 0 or has an average value of 1-30; and when R_4 contains $<$8C then Y is methyl and n $\geqslant$ 3.

The emulsion can readily be broken by addn. of acid or alkali to decompose (I). It is esp. useful in the form of a metal-working fluid, e.g. a cutting or rolling oil. The oil component is readily recoverable after use. 25.3.76 (6pp927)

UNIL D25 79396X/43 =GB 1540-722
Fabric conditioning compsn for use in washing rinse - contg anti soiling agent and softener of solubility below 500 ppm
UNILEVER LTD 15.04.75-GB-015450
*A87 E16 F06 (A97 E14) (14.02.79) *BE-840-614 +C08l-05/16 C08l-77*

Fabric treatment compsn. comprises (A) (i) a condensatio prod. (I) or (ii) a reaction prod. of an alkylene oxide with polyamide; (B) a cationic fabric softener cpd. having a solubility in water of ≯500 ppm at 25°C; and (C) an aq. medium.

(I) is a condensation prod. of (a) an aliphatic dicarboxylic acid or an ester- or amide-forming deriv. thereof; (b) a hydroxy-polyoxyalkylene cpd. contg. $\geqslant$1 polyalkylene chain consisting of oxyalkylene radicals linked directly to one another, or an ester- or amide-forming deriv. thereof; and (c) a cpd. selected from (1) a (cyclo)aliphatic amino acid or lactam; (2) a (cyclo)aliphatic diamine or a salt thereof with an aliphatic dicarboxylic acid; (3) a mixt. of (1) and (2) and (4) an ester- or amide-forming deriv. of (1), (2) or (3).

Compsn. is used in a rinsing process subsequent to a washing operation. It provides improved softness and soil release effect, and is esp. suitable for treatment of polyamide fabrics. 13.4.76 (5pp927)

UNIL D25 81222X/44 =GB 1540-832

Powdered spray-dried detergent compns - from aq suspensions giving homogeneous incorporation of activators of per-compounds

UNILEVER LTD 18.04.75-GB-016147

*E19 (E37) (14.02.79) *BE-840-887 C11d-03/39 C11d-11*

Prodn. of a detergent powder compsn. comprises (i) forming an alkaline aq. slurry of a surfactant, a builder salt and an organic activator for peroxy cpds. having a hydrolysis rate (as measured by a described test) of ≯15%; and (ii) spray-drying the slurry to form a particulate compsn. having the activator homogeneously distributed in it.

Pref. slurry comprises 40-60 wt.% of water and 0.2-10 (esp. 0.5-7.5) wt.% of the activator. The activator is pref. N,N,N',N'-tetraacetylethylene diamine. Pref. the slurry is heated to 60-90°C before spray-drying, and is spray-dried at an inlet air temp. of 275-350°C and an outlet air temp. of 100-115°C.

Method provides a stable prod. in which sepn. of the activator during transport and storage is minimised. 15.4.76 (8pp927)

DUPO D25 57582X/30 #GB 1540-858

Decreasing soil redeposition of dry cleaning fluids - by adding an organic ester of ortho-titanic acid

DU PONT DE NEMOURS CO 20.01.75-US-542235 (12.04.76-GB-014831)

*E12 G04 (14.02.79) *US3969-073 +C11d-01 C11d-03/20 C11d-10/02*

Textile cleaning compsn. comprises textile dry cleaning organic solvent and 0.1-2.0 wt.% dry cleaning detergent and 0.01-0.3 wt.% organic ester of ortho-titanic acid.

Pref. organic ester of ortho-titanic acid is tetraisopropyl-, tetrastearyl-, tetrakis(2-ethylhexyl)- or tetrabutyl titanate or titanium diisopropylate diacetylacetonate. Compsn. additionally contains ≯1.5 wt.% water. Process for dry cleaning comprises agitating textile material in compsn. contained in bath, separating material and drying.

Compsn. results in marked reduction in soil redeposition on fabrics during cleaning as well as improved cleaning efficiency. Compsn. are applicable to dry cleaning processes where oil and water repellents such as wax and polyfluoro repellent materials are incorporated into liq. 12.4.76 as 014831 (5pp931)

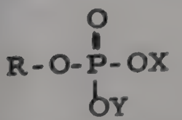
KAOS ★ D25 12731B/07 ★J5 4001-307

Detergent compsn. for dry cleaning use - contain alkyl phosphate ester cpds. and pref. nonionic surfactant comprising fatty acid ester

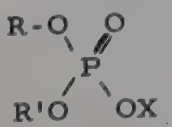
KAO SOAP KK 06.06.77-JA-066476

A97 E11 G04 (E17) (08.01.79) C11d-07/60 C11d-10/02

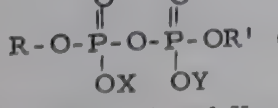
Detergent compsns. for dry cleaning are composed of alkyl phosphate esters of formula (I), (II) and (III) which form 4-50 wt.% in the compsns.



$R-O-\overset{O}{\underset{OY}{P}}-OX$ (I)



(II)



$R-O-\overset{O}{\underset{OX}{P}}-O-\overset{O}{\underset{OY}{P}}-OR'$ (III)

(where R and R' are 6-10C alkyl or alkenyl; X and Y are alkali metal or alkaline earth metal). The compsns. pref. contain 0.5-30 wt.% nonionic surfactants comprising mono or diester of 10-20C fatty acid with polyethylene glycol with average polymerisation degree 2-200, or mono-, di- or triester of 10-20C fatty acid with sorbitan or polyoxyethylene sorbitan with ethylene-oxide addn. mol. no. < 200.

The detergent compsns. provide simultaneous washing, antistatic treatment and softening treatment, while eliminating fundamentally the disadvantages pertaining to the use of cationic surfactants, like development of disagreeable odour, discolouration when used in combination with fluorescent dyes and corrosion of metals. 6.6.77 as 066476 (7pp43)

ASAH ★ D25 13118B/07 ★J5 4003-107

Tri:carboxylic acid additive for soaps and cleaners - improving soap solubility in water

ASAHI CHEMICAL IND KK 10.06.77-JA-067860

E14 (E12) (11.01.79) C11d-03/20 C11d-09/26

Novel additive for soaps and cleaners is of formula CH$_2$(COOM$_1$)-CH$_2$-CH$_2$-CH(COOM$_2$)-CH$_2$-CH$_2$(COOM$_3$) (I) (where M$_1$, M$_2$ and M$_3$ are H, Na, K, Li and/or NH$_4$).

Solubility of soap and cleaner in water is increased (i.e. content of solid soap can be increased). Cpds. of nitrogen and phosphorus are not present (i.e., components encouraging growth of algae and undesirable water plants are avoided). The tricarboxylic acid can be prepd. easily by the hydrolysis of 1,3,5-tricyanohexane which is the byproduct in the electrolytic dimerisation of acrylonitrile. It is neutralised with alkali, and usually added in amt. of 1-90 wt.% (pref. 5-70 wt.%) on solid soap. 10.6.77 as 067860 (4pp170)

DOWC ★ D25 14072B/07 ★US 4138-352

Detergent for synthetic fabrics, esp. polyester(s) - comprises polyethylene glycol alkyl mono:ether, sodium sesqui:carbonate, sodium silicate hydroxy:butyl methylcellulose and sodium carbonate

DOW CHEMICAL CO 03.02.78-US-878122 (23.04.76-US-679536)

A97 E34 (A11 A25 E17) (06.02.79) C08b-11/19 C11d-03/37 D06m-13/18 D06m-15/24

The compsn. contains (by wt.) (a) 20% of an 8-22C alkyl monoether (I) of a polyethylene glycol having 5-20 alkylene oxide units; (b) 60% Na sesquicarbonate; (c) 10% Na silicate (SiO$_2$:Na$_2$O ratio 2-3:1) (d) 0.1-2% hydroxybutyl methylcellulose (II) of DS 1.5-2.3 and MS 0.01-0.6; and (e) 10% Na$_2$SO$_4$.

The compsn. inhibits the redeposition of soil, imparts potent antisoil props. to fabrics, and is partic. useful for washing synthetic fabrics, esp. polyesters. In an example a compsn. was prepd. from surfactant (20%) NaHCO$_3$. Na$_2$CO$_3$ (60%), Na silicate (SiO$_2$:Na$_2$O-2.4:1) (10%), (II) (1%), and Na$_2$SO$_4$ (9%). 3.2.78 as 878122 (+7.3.77-US-775136)(7pp478)

PQCO- ★ D25 14076B/07 ★US 4138-363

Sodium form zeolite for use as detergent builder - is reacted with silane having hydrophilic functionality to reduce agglomeration

PQ CORP 14.09.77-US-833122

E33 (E11) (06.02.79) B01j-29/06 B01j-31/02

A hydrophilic silane zeolite compsn. consists of 96.65-99.95 wt.% zeolite and 0.05-3.35 wt.% of a silane having a hydrophilic functionality. The zeolite is in the Na form and contains 15-35% in water. Used as a builder in detergent compsns. The silane modified zeolite does not agglomerate with other detergent ingredients.

Suitably, the zeolite is slurried in a soln. of 0.1-0.9 wt.% water in an organic solvent and a silane contg. an acrylate, epoxy, amine or carboxylate gp. is added to react with the zeolite surface. The organic solvent is then removed. Pref. the zeolite has the formula $Na_x[(AlO_2)_x(SiO_2)_y]\,ZH_2O$ where x and y are each $\geqslant$ 6 and the molar ratio x:y is 0.1-1.1:1. 14.9.77 as 833122 (4pp1302)

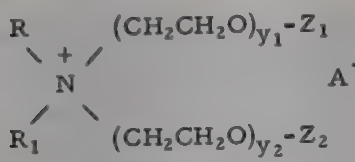
GENA D25 77054Y/43 =US 4138-371

Amphoteric surfactants, useful in soap and shampoos - comprise sulphated quaternised ethoxylated long chain alkylamines

GAF CORP 07.04.76-US-674442 (09.04.73-US-349560)

*A25 (A97) (06.02.79) *NL7612-898 C11d-01/12*

Aq. compsn. for washing human hair and skin contains amphoteric surfactant of quat. ethoxylated amine of formula (I) where R is 8-14 alkyl, R_1 is 1-2 alkyl or benzyl, y_1 and y_2 are each integers with sum 5-50, Z_1 is with the bonded O, a sulphate ester in free acid form or as sodium, potassium, calcium or magnesium salt, Z_2 is H or Z_1, A is a halide, sulphate, 1-2C alkyl sulphate or mixt.



$$R(R_1)N^+(CH_2CH_2O)_{y_1}\text{-}Z_1(CH_2CH_2O)_{y_2}\text{-}Z_2\ A^-$$

(I)

Pref. Z_1 is sodium salt, R_1 is ethyl and A is ethyl sulphate or R_1 is benzyl and A is chlorine. Sum of y_1 and y_2 is 10-20. Pref. R is derived from cocoamine. Compsn. is in aq. soln. of a shampoo formulation contg. 20% surfactant and 1.5% of long chain amine oxide, or bubble bath concentratecontg. 20% surfactant and 5% coconut diethanolamide.

Cpds. have advantage of preventing accumulation of electrostatic charges, impart a soft hand to hair and permit ready combing. 8.8.77 as 822703 (+25.3.75-US-561673)(8pp931)

KHOD/ ★ D25 14099B/07 ★US 4138-425

Anionic surfactant prepn. - from phenol extracts of petroleum distn. by propoxylation, then sulpho-esterification

KHODZHAKHANOV N A 09.11.77-US-849982 (14.02.72-US-226307)

E14 H01 M25 (06.02.79) C07c-141/16 C11d-01/22

New anionic surfactants are of formula (I) R-Ar-$(CH_2)_3$-O-SO_3NH_4 (where R-Ar is a radical resulting from phenol extracts obtd. from the bottoms of petroleum distn.; R is 9-15C aliphatic radical; and Ar is a mixt. of benzene, naphthalene and anthracene radicals).

(I) are prepd. from readily available, inexpensive starting materials, and are useful as domestic detergents, as floating agents in metallurgy, as mud fluid stabilisers, and as antifoam agents. (I) are readily and completely soluble in H_2O and EtOH, and reduce H_2O surface tension to 27-29 erg/cm^2 (with known detergents, redn. is to 30-32 erg/cm^2).

In an example, a (I) was prepd. in 85% yield by alkylation of a phenol extract (obtd. in a petroleum distn. at 360-500°C) with propylene oxide and NH_4Cl at 30°C, followed by treatment with NH_2SO_3H and urea (catalyst) in petroleum ether for 2 hr. at 115°C. 9.11.77 as 849982 (3pp478)

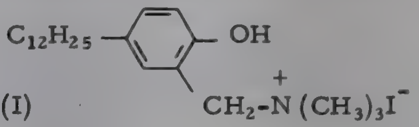
UNIL D25 32625Y/18 #US 4138-435

Novel hydroxamic betaines - useful as fabric softeners compatible with surfactants

LEVER BROTHERS CO 19.09.72-GB-043274 (03.12.76-US-637249)

*E19 F06 (06.02.79) *US4020-100 +C07c-87/30*

N-(dodecyl-hydroxybenzyl)-N,N,N-trimethylammonium iodide of formula (I) is prepd. for use in detergent compsns. by adding 0.3 mol of 30% aq. formaldehyde to 0.2 mol. of dodecyclphenol in 100 ml. ethanol, then using solvent extraction procedure by addition of 30% ethanolic dimethylamine, product being contained in oily layer.



(I)

Detergent compsn. are formed by hydroxamic betaines with formula $R^1(R^2)(R^3)N^+\text{-}R^4\text{-}CO\text{-}NH\text{-}O^-$ where R^1, R^2, R^3 and R^4 are 1-25C hydrocarbons such that betaine has < 45C, ≥ 1 carbon chain has ≥ 12C, carbon chain of R^4 between the quat. N and carbonyl gp. is ≤ 4C.

Compsn. are used in fabric softening rinse compsns. as well as detergents, remain in dispersion during the washing process, but deposit onto the fabric when the pH decrease during subsequent rinsing. 27.12.76 as 754720 Div. ex. 4020100 (+3.12.76-US-637249)(4pp931)

Central Patents Index

NEWSLETTER

4th April 1979.

1979 No. 6

1. 1979 SUBSCRIBER MEETINGS

The 1979 CPI Subscriber Meetings will be held as follows:

Washington	Stouffers National Center Hotel (Crystal City)	9-11 May
London	Heathrow Hotel (London Airport)	21-23 May
Tokyo	Okura Hotel	11-12 June

Meeting registration forms and details of the hotels were sent to all subscribers on Wednesday, 7th March and an additional registration form is attached to this Newsletter. Subscribers wishing to attend the meetings are asked to complete and return a copy of the form as quickly as possible.

Following the very successful meeting last year we are anxious to include as many papers as possible from subscribers on all aspects related to patents and the use and future development of Derwent Services.

Those intending to submit papers themselves or with suggestions for topics which they feel would be of general interest should contact Derwent without delay.

2. CPI/WPI CUMULATED INDEXES, 1974-78 AS COM

MICROFILM

All sections of the Basic Patentee Index were despatched to subscribers by the week ending 16th March, 1979. IPC, Patent Number Family and Priority Concordance Indexes were despatched by week ending 30th March. Accession Number Index is being despatched with this week's materials.

MICROFICHE

All sections of the Accession Number Index were despatched to subscribers by week ending 16th March. All remaining indexes were despatched by week ending 30th March.

3. BRAZILIAN PATENTS GAZETTE

As from 20th February, 1979, the above Gazette is publishing abstracts of patent applications instead of merely titles. This will enable Derwent to produce a more informative title and improved classification as from Week B10.

4. PRINT RESTRICTIONS IN SDC ONLINE FILE

In addition to restrictions imposed on users depending upon which Derwent sections they subscribe to, users should be aware of the following limitation:- if a restricted search parameter, e.g. MP or MC, is ORed with an unrestricted parameter, e.g. IC, then the restriction is applied to all hits, whether they are obtained from the restricted or unrestricted parameter, e.g. if a user with a full subscription to Section M only inputs the search M21-L/MC OR ALL B21L:/IC then the user would only be allowed to print hits classified in CPI Sections to which the user had a full subscription, i.e. Section M, and any hits obtained from the IPC which were not classified in Section M would be restricted.

It would be very difficult to modify the SDC program to avoid this restriction, and the only way subscribers to less than 4 CPI subscription units can overcome the problem is to enter the parameters as separate search statements, print the hits from both and manually check for hits common to both.

*5. COM LISTINGS OF SECTION A PUNCH POSITIONS BY ACCESSION NUMBER

Subscribers who have purchased these lists, as either fiche or roll film, should note that the following control positions (for use in searching over ranges) have been omitted from the lists:

(a) 01& from 60, 001P to 06000Q

(b) 65& from Week R01 onwards

(c) 06& from Week V01 onwards

If a search is to be conducted over a restricted chronological period these positions should be incorporated into the search logic as appropriate.

Subscribers still wishing to order these lists (and also those for the B, C and E codes) should refer to Item 11 of CPI Newsletter No. 5 of 21st March where details of costs, etc., are given.

*6. SDC ONLINE FILE POSITION

WPI	SDC has updated to	Update code
Bibliographies	B05	7901
Manual Codes	B03	7901 (part)
Multipunch A + Key Terms	A39	7810
Multipunch BCE	A48	7812

*7. DESIGNATED STATES GIVEN ON WP ABSTRACTS

National (N)- and European (E)-applications as specified on the PCT patent applications are treated in our publications in the following manner:

(a) Country code plus E if EP coverage only.

(b) Country code plus N if national application under PCT for European countries.

(c) Country code only if both EP and national application under PCT for European countries.

(d) Country code only if non-European application.

*8. INSTRUCTION MANUAL No. 6A - THIRD EDITION, MARCH 1979.

A revised edition of the 'List of Standard Thesaurus Terms' is being distributed to subscribers with their materials this week. Additional copies are available price £2 or $4 from our Patents Supply Division.

*9. DELAYED BRITISH PATENTS

The patents which were omitted from Weeks B03-B05 due to delays in printing have now been received and have been included in WPI/CPI as follows:-

Examined from	B03 in B09
Examined from	B04 in B10
Examined from	B05 in B11
Unexamined from	B05 in B12

*10. US OFFICE

For the time being, at least, Derwent will not be sending any London based staff for short periods to the office in Crystal City.

Whilst this absence of our staff continues our US Representative, Mr. E. J. Brenner, and his staff, will be providing extended coverage than hitherto so as to ensure that all customer enquiries are dealt with efficiently and expediently. Any enquires they are unable to answer immediately will be directed to London by telex for an immediate response. To assist subscribers a telephone answering service is being employed to handle any calls made outside of normal office hours.

REGISTRATION APPLICATION

CENTRAL PATENTS INDEX
ANNUAL SUBSCRIBER MEETING 1979

The Heathrow Hotel (London Airport)
Bath Road, Heathrow, Hounslow TW6 2QA
21st-23rd May

Please complete in BLOCK LETTERS or type and return as soon as possible, but no later than 17th April, to Derwent Publications Ltd. Please use a separate form for each person wishing to register.

(1) NAME AND COMPANY

Name:..

Position:..

Company:..

Address:..

....

....

(2) ACCOMMODATION

Please reserve the following accommodation for me at the Heathrow Hotel at room rates of £25 per night for single rooms and £28 for double rooms plus VAT and service:

Sunday, 20th May	Single ☐	Double ☐
Monday, 21st May	Single ☐	Double ☐
Tuesday, 22nd May	Single ☐	Double ☐

Additional accommodation (please specify)*: ....

....

Please tick if you are attending our Literature Division Meetings on 17th and 18th May. ☐

**Do not complete this section if your additional requirements relate to attendance at Literature Division Meetings, for which a separate Registration Application Form is available.*

SCHEDULE OF FUTURE DESPATCHES

Due to a recent computer failure resulting in a disruption of our production schedules and for forward planning to allow for forthcoming Easter Holidays, the despatch of materials will be a few days later than the usual Wednesday date for the next few weeks but will return to normal by Wednesday 16th May. We apologise in advance for any inconvenience that these delays may cause to subscribers. The schedule of despatch for the next six weeks is given below:

B08 - Mon, 9th April
B09 - Tues, 17th April
B10 - Mon, 23rd April
B11 - Fri, 27th April
B12 - Thurs, 3rd May
B13 - Thurs, 10th May
B14 - Weds, 16th May

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry
H	Petroleum
J	Chemical Engineering
K	Nucleonics, Explosives, Protection
L	Refractories, Ceramics
M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11: BAKING

JOUL/ ★ D11 14242B/08 ★BE -871-229
Mfr. of loaves of bread, esp. French sticks - by half-baking, vacuum packaging and sterilising prior to storage
JOULIN G 21.10.77-FR-031710
(01.02.79) A21d

The process is of the type in which dough is made from flour, water, yeast, etc. and then kneaded and formed into loaves which are allowed to ferment and then baked. Initial baking is only partial, i.e. it is curtailed to a stage at which the loaf is structurally self-supporting but is not browned. The partly baked loaf is then vacuum packed and the package and contents heat sterilised.

Curtailment of initial baking pref. takes place when the temp. at the centre of the loaf is between 70 and 100°C. Initial baking time pref. lasts about half the duration of normal baking.

These loaves can be kept as emergency stock for peak demands by hotels, restaurants and other catering establishments. They remsin fresh for months without refrigeration and can be made ready for serving as freshly-baked bread by placing in a hot oven for ten mins. or so. 13.10.78 as 871229 (12pp448)

HACK- D11 57013A/32 =DS 2703-900
gingerbread house components - with anchoring portions fitting in mating recesses
HACK FEINBACKWAREN 31.01.77-DT-703900
*(15.02.79) *DT2703-900 A21d-13*

Shaped components of gingerbread, which form a house when assembled, have one or more fixing zones where one component bears against another inclined to it. In each such zone one component has a protrusion fitting in a mating recess in the other one. The design is simple both to mfr. and to assemble. 31.1.77 as 703900 (5pp160)

INTT ★ D11 14390B/08 ★DT 2735-622
Dough proving oven ventilating system - has moist air discharged through duct across top, to atmos., and catalyst inside duct
STANDARD ELEK LOREN 06.08.77-DT-735622
Q74 (15.02.79) F24c-15/32

The oven or chamber for dough proving, with a door at the front, has a chamber at the back, contg. the heating coil. Inside this is a fan rotor which forces air into the interior through gaps at the sides, driven by a motor at the rear. The moist air is then forced out centrally near the fan.

The moist air travels upwards to the top of the rear chamber, and is discharged through a channel over the top, and above the door. Inside this channel is located a catalyst. 6.8.77 as 735622 (6pp349)

PLAS/ ★ D11 ✓ 14397B/08 ★DT 2736-094
Dietetic bread stimulating intestinal activity - is prepd. by baking dough contg. wheat groats, water, yeast and salt
PLASSMANN S 10.08.77-DT-736094
(15.02.79) A21d-13/02

Dietetic bread is prepd. by baking a dough contg. by wt., 45-55 (48-50)% wheat groats, 45-55 (48-50)% water, 1.5-2.5 (1.9-2.1)% yeast and 0.4-0.6 (0.4-0.5)% salt. Pref. the dough, prepd. by mixing the individual components, is left to stand 2-10 (4-8) hrs. and then baked 40-60 (50) min. at 180-250 (200)°C opt. in a mould.

The coarse grain-rich bread stimulates intestinal activity and prevents body-retention of toxic materials. Teeth and gums are massaged and cleansed while eating. The wheat groats are easily obtd. and the bread is prepd. more cheaply than so-called "biological-dynamic" foods. The dough is prepd. easily and can be baked in a domestic oven. High vitamin B content promotes body-functions, e.g. hair growth. 10.8.77. as 736094 (7pp200)

ASCH/ ★ D11 ✓ 14443B/08 ★DT 2831-729
Dietetic bread compsn. - comprising a dough contg. wheat flour, wheat germ, bran, soy flour, yeast, salt and water
ASCHINGER A 02.08.77-CH-009518
(15.02.79) A21d-13/06 A23l-01/30

Low-carbohydrate, calorie-reduced dietetic bread is produced by forming a dough comprising 10-20%(15%) wheat flour, 10-20% (15%) bran, 7-15% (10%) wheat germ, 5-10% (7%) soy flour, 1.5-3% (2%) yeast, 1-2% (1-1.4%) salt and 45-55% (50%)water, kneading the dough for a time several times longer than for normal bread and baking. The soy flour is pref. defatted.

The bread has 30% less calories and 60% less carbohydrate than normal bread and an acceptable taste. 19.7.78. as 831729 (7pp922)

BALD/ ★ D11 14507B/08 ★FR 2390-902
Bakery transfer mechanism for dough lumps from flat conveyor - which automatically tilts sideways to drop lumps into proving pockets
BALDELLOU M 18.05.77-FR-016072
(19.01.79) A21c-09

The mechansim distributes dough lumps from a flat band conveyor, e.g. into proving carrier pockets in which the dough lumps are fermented.

The conveyor is hinged along one side edge to a fixed support. The other side edge of the conveyor can be lowered and raised between a conveyor horizontal position and a downward tilting postion which discharged dough lumps by gravity.

The outer, side edge of the conveyor is linked by a connecting rod to a powder-actuated eccentric. Automatic, electric actuation is initiated each time the full length of the conveyor is full of dough lumps, e.g. by a timer synchronised with the conveyor drive. 18.5.77 as 016072 (5pp)

MATE- ★ D11 14552B/08 ★GB 1540-995
In/line pie making machine - with a supplementary conveyor for relaxing and cooling dispensed pastry portions
MATELINE AUTOMATION 03.05.75-GB-018616
(21.02.79) A21c-09

In an in-line machine for making pies using hot water or boiled pastry having a main conveyor for transporting pastry portions past stations for blocking and filling the portions and a supplementary conveyor is provided which has a number of carriers each supporting at least one pocket for receiving pastry portions from a pastry dispenser and which conveys pastry portions around a separate relaxing and cooling circuit for delivery of the relaxed and cooled pastry portions to the main conveyor upstream of the blocking station.

Used particularly in the mfr. of pies with hot water or boiled pastry casing such as pork pies. Pastry must be relaxed and cooled to allow a skin to form before shaping, by blocking, into the desired shape. In hand made pies the tins, once filled with pastry, are left for some time to relax and cool, taking up considerable space. The automatic machine utilises proper control and regulation of the cooling and relaxation. 3.5.76 (4pp50).

CALP- ★ D11 ✓ 14566B/08 ★GB 2002-222
Treatment of wheat flour - with acetic acid, propionic acid, or ethanol, to replace natural ageing
CALPIS FOOD IND KK 13.08.77-JA-097140
E17 (21.02.79) A21d-02/14 A21d-06

The confectionery properties of wheat flour (I) are improved by addn. of acetic acid, propionic acid and/or ethanol, then storage and/or heating. Rapid, economical treatment with the volatile, readily removed additives successfullyreplaces natural ageing of wheat flour (normally 6 -12 months), and affords (I) suitable for use in the prodn. of cakes and Japanese-style confections (giving no 'cave-ins' or half-cooked layers, etc.).

In an example, weak flour which had been kept for 20 days after being milled was sprayed with 15% aq. HOAc (0.67 pts./100 pts. of flour). The treated flour was then stored for 30 days at 25°C to give a prod. which was used to prepare excellent cakes. 10.8.78 as 032861 (7pp478).

SATO/ ★ D11 15082B/08 ★J7 9001-781
Fermenting and baking bread dough contg. flour, yeast and milk - and mixed with dough on which Neurospora sitophila has been cultivated
SATO S 24.12.70-JA-116704
(D16) (29.01.79) A21d-08/04

To dough for bread contg. a least flour and yeast is added milk condensed milk, defatted milk etc. followed by kneading. On the other hand, microorganism Neurospora Sitophila is cultivated on a bread dough contg. at least flour and yeast. The two doughs are mixed followed by fermentation.

Bread having good properties can be obtd. in short fermentation time. 24.12.77 as 116704, A21d-8/04, (29.1.79) SATO S,MIYAJIMA T (3pp22)

MEIJ ★ D11 15086B/08 ★J7 9001-785
Baked cookies with improved flavour, taste and touch - prepd. using chocolate chips produced by shaping and solidifying chocolate-ethanol mixt.
MEIJI KK 05.06.73-JA-062570
(29.01.79) A21d-13/08 A23g-03

Chocolate material is mixed with 1-5 wt.% (as alcohol) of 95% ethyl alcohol, and the mixt. is shaped and solidified to give chocolate chips. The chips are mixed with baked cookie material and the mixt. is baked. Flavour and taste as well as touch are improved. 5.6.73 as 062570 A21d-13/08, A23g-3/00, (29.1.79) MEIJI SEIKA KAISHA (3pp22) (J50012263)

SHOS ★ D11 15087B/08 ★J7 9001-786
Corn cap or wafer prepn. - by baking a slurry contg. flour, malt flour, corn starch, sugar, oil, salt etc.
SHOWA SANGYO KK 25.10.73-JA-119421
(29.01.79) A21d-02/38 A21d-13/08

In prepn. of corn cap. or wafer, malt flour is added to the slurry starting material, e.g. flour, malt flour (in amt. 0.1-2% w.r.t to flour), corn starch and other components such as sugar, oil, salt, etc. are mixed and kneaded and the resulting slurry is baked in conventional manner to give corn cap having homogeneous properties and homogeneous and smooth appearance. 25.10.73 as 119421 A21d-13/08, (29.1.79) SHOWA SANGYO KK (3pp22) (J50070557)

Flat food with rectangular cavities - formed by passing viscoelastic dough between rollers, pulling dough apart then scraping off
KAMEDA SEIKA KK 24.06.75-JA-078453 (06.06.75-JA-068375)
(23.08.77) A21d-13/08 A23l-01/16

A sheet-like food product has a pair of facing sheets sepd. by bulkhheads which create rectangular chambers. The chambers extend longitudinally through the produce and are formed by the facing sheets and bulkheads.

The product is made by passing a viscoelastic dough cake of edible vegetable material through the nip of a pair of contrarotating rollers. The dough clings to the surface of the rollers and is expanded as it moves through the downstream side of the nip. A pair of doctor blades scrape the expanded dough from the surface of the rollers to form the product. The dough may be gelatinised starch, rice, wheat or potatoes.

The apparatus produces a thin wafer-like expanded sheet food product. The rectangular chambers are integrally formed without the need to apply facing sheets to a corrugated interior as used previously. This reduces the cost of the apparatus and allows thinner products to be formed. 2.6.76 as 692037 (6pp295)

NOEL/ ★ D11 15457B/08 ★US 4106-400
Muffin griddle with cup and cover conveyors - operates by moving dough over heater then inverting and grilling other side
NOEL E M 14.07.77-US-815496
P28 (15.08.78) A47j-37

A muffin griddle comprises a conveyor with cups which are loaded with dough balls. The conveyor carries the cups over a burner array while the mouths of the cups are closed by covers. These covers are attached to an overhead conveyor which converges with the cup conveyor to constrain the dough while it is cooked.

After cooking the cup and cover conveyors pass simultaneously round a roller to invert the cups. In this inverted state the cups are again heated and finally the conveyors diverge to leave the cooked muffins on the cover conveyor. 14.7.77 as 815496 (12pp295)

Three-stage mixing of dough - using differing mixing speeds, producing lower final dough temp.
AMF INC 22.11.76-US-743450 (14.07.75-US-595469)
(15.08.78) A21d-08/02

Raw dough ingredients are introduced into a mechanical mixer which is initially operated for a first time interval at a speed sufficient for preliminary blending of the ingredients. The mixing speed is then increased for a second time interval to develop the blended ingredients into a cohesive mass. The mixing cycle is terminated by reducing the mixing speed for a third time interval for final developing of the dough. This reduced mixing speed is greater than the mixing speed during the first time interval.

The method is used for preparing a batch of dough. The final dough temp. is about 4° cooler than using previous methods. The total mixing time is reduced by about 13%. 22.11.76 as 743450 (295)

Two/way folded three/dimensional crackers - with central cavity contg. printed fortune telling article
KITAMURA S 01.07.77-US-812332
(13.02.79) A21b-01/46 A21c-15

An appts. folds a baked circular cracker into a three dimensional product. The cracker is placed across two parallel vertical plates so as to span the gap between them. Each plate has a vertical slot and fingers press the cracker into the slots to produce a diagonal fold. A bulging plate is located midway between the plates and engages the midpoint of the folded cracker while the fingers descend further in the slots. The fingers next move inwards to further distort the cracker.

The motion of the fingers is controlled by vertical and horizontal cams driving sliding bars to produce the required motion. Pref. a printed fortune is placed in each cracker before it is folded. 1.7.77 as 812332 (9pp295)

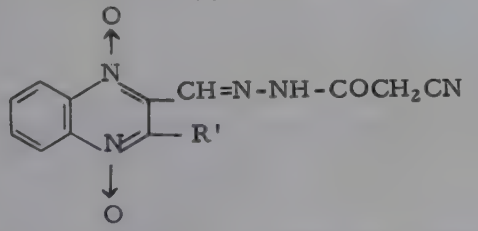
2-Formyl-quinoxaline-1,4-di:oxide-cyano-acetyl hydrazone derivs. - are antimicrobials with coccidiostatic properties and growth stimulators for domestic animals such as pigs
SPOFA SPOFENE FARM NP 02.08.77-CS-005118
B02 C02 (15.02.79) A23k-01/16 A61k-31/49 C07d-241/52

2-formylquinoxaline-1,4-dioxide cyanoacetyl hydrazone derivs. of formula (I) are new (where R' is H or 1-4C alkyl).



(I)

(I) are antimicrobials effective against numerous gram positive and gram negative microorganisms. (I) also have coccidiostatic properties and are powerful growth stimulatos for domestic animals such as cows and pigs, also having a beneficial influence on the general health of these animals. (I) are less toxic than non-antibiotic growth stimulators. (I) increase the utilisation of mixed foodstuffs by the animals and reduce the occurrence of diarrhoea in piglets. (I), opt. in combination with other veterinary medicines guard against and treat salmonella and dysentry in pigs and other domestic animals.

In an example, a specifically claimed cpd., 2-formylquinoxaline-1,4-dioxide cyanoacetyl hydrazone was obtd. in 85% yield by reacting 15.2 g 2-formylquinoxaline-1,4-dioxide with 7.9g cyanoacetylhydrazine. 5.7.78. as 829580 (19pp1401)

Porous chocolate prodn. using continuous mixer - into which gas is fed under pressure to dissolve in chocolate and form bubbles once pressure is released
OAKES E T LTD 27.07.77-GB-031655
(15.02.79) B01f-03/04

Porous chocolate is manufactured by taking the molten raw material and mixing a gas into it. Bubble formation is subsequently encouraged. The gas is introduced into the liquid under a pressure at which it is soluble or as a liquid. It is uniformly distributed in the chocolate and dissolved in it.

It is then subjected to a sudden reduction in pressure so that the dissolved gas forms bubbles throughout the liquid. The chocolate is cooled to form a solid prod. The liquid is pumped by a pump continuously into an in-line mixer. The pressure reduction is achieved by passage through a throttling valve with a means of adjusting it. The product is subjected to vibration as it leaves.

Process enables continuous prodn. of such chocolate c.f. existing process in one vessel which is time and labour consuming. 25.7.78. as 832521 (16pp1053)

NEST ★ D13 14456B/08 ★DT 2832-843
Vegetable protein extracts - obtd. by sepn. after acidification of the aq. medium within a specified range above the isoelectric pH
SOC PRODS NESTLE 03.08.77-CH-009533
(15.02.79) A23j-01/14

Vegetable protein extract (I) is obtd. from aq. media by first adjusting the latter's pH within the range 150 + 0.5⩽pH ⩽150 + 1.2 (where 150 is the isoelectric pH) and removing (I) in solid form.

(I), an isolate or concentrate, has a low content of phytic acid trypsin inhibitor and oligosaccharide., i.e. (I) is recovered in lower quantitative yield but is of higher quality. 26.7.78. as 832843 (18pp922)

Dry powder contg. soybeans and unmilled rice - easily dispersed to make synthetic milk or skin tonic
SAKAMOTO K 05.06.75-JA-067077 (02.04.75-JA-039252)
(21.02.79) A23l-02/38

Soybeam-contg. powder is made by first drying raw or defatted soybeans at <100°C and <67mm Hg. The dried beans are then mixed with unmilled rice which has been dried separately from, or pref. together with, the beans, and the mixt. ground.

Opt. ⩾1 plant with medicinal properties which has been dried at <100°C and reduced pressure is also added alternatively a distillate of such plants obtd. at <100°C is used. Specified plants are garlic, aloe, mugwort and cattail.

The powder is easily dispersed in cold or warm water to give a proteinaceous beverage (milk substitute). It has good preservability (improved by incorporating garlic) and is easy to handle. The addition of rice removes the typical soybean smell and by drying at low temp. and pressure the structure, flavour etc of the starting materials are retained. A small amt. of the powder dissolved in water and rubbed into the face acts as a skin tonic. 22.1.76 as 002470 (5pp1251).

Sepg. a corn starch milk into protein and starch - using multistage sepn. and washing using hydrocyclones
CPC INTERNATIONAL INC 22.10.76-US-734683
*+P41 (D17) (21.02.79) *BE-859-954 C13l-01 +C07g-07*

System for treating the mill starch fraction (I) of a corn wet milling process to give a protein-rich prod. and a starch-rich prod. is claimed. System comprises a first sepn. zone contg. ⩾2 protein sepn. stages (A) and a second sepn. zone contg. starch washing stages (B), each stage of (A) and (B) including hydrocyclones which consist of a vortex member, a conical member and an apex member.

(I) is fed under pressure successively through (A) to give a protein-rich stream (discharged through the vortex members) and a starch-enriched stream (discharged through the apex members). The pressure differential between each (A) is maintained at ⩾100 psi. A protein rich prod. is sepd. from the last protein sepn. stage (A). The heavier, faster settling materials discharged from the apex members of the second (A) stage are combined with (I).

The starch-enriched stream discharged from the apex members of the first (A) stage are fed under pressure through (B) to discharge the lighter, slower settling materials (II) through the vortex members and the heavier, faster settling materials through the apex members. (II) from one (B) stage are recirculated to an upstream (B) stage where they are combined with the starch-enriched stream fed to that stage. The lighter, slower settling materials from the second sepn-zone are recirculated and combined with (I). The pressure differential between each (B) is maintained at ⩾80 psi.

A starch rich-prod. is removed from the last (B) stage. Wash water is countercurrently passed through the system and is introduced adjacent the penultimate (B) stage. 21.10.77 as 043985 (16pp992).

BEAF ★ D13 14565B/08 ★GB 2002-217

Natural tasting cheese substitute compsns. - contg. congealed mixt. of milk derived protein, vegetable fat, and water

BEATRICE FOODS CO 12.08.77-US-824214

(21.02.79) A23c-19/12 A23c-23

Cheese substitute compsn. consists of a congealed mixt. of milk derived protein (I), vegetable fat (II), and H_2O. Wt. ratios (I):(II)=1-4:4-1, and H_2O:(I)+(II)=1-4:3-1, while in part at least (I) is proteolytic enzyme clotted milk protein.

The cheese substitute does not have an objectionable casein(ate) taste, but (cooked or uncooked) does have both the texture and background cheesy flavour of natural cheese. In an example, a prod. made from fat (21.2%), rennet casein (28%), H_2O (44.5%), polyphosphate emulsifier (3%), Na citrate (0.5%), 88% lactic acid (1.8%), K sorbate (0.1%), and NaCl (1.4%) was shown on melting to string similarly to mozzarella cheese. 14.8.78 as 033281 (10pp478).

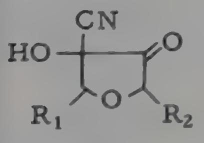
4-Cyano-tetra:hydro-furan-3-one(s) and 4-hydroxy derivs. - intermediates for 4-hydroxy-3(2H)-furanone(s) useful as flavouring agents

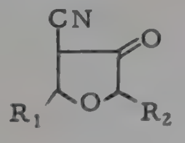
GIVAUDAN L & CIE SA 14.12.77-LU-078691 (11.08.77-LU-077955)

E13 R29 (21.02.79) G07d-307/02

Cyanofuranones of formulae (II) and (III) (where R_1 and R_2 are each H or (m)ethyl are new.



(II)



(III)

(III) and (II) are intermediates in the synthesis of known 2,5-di-R-substd.-4-hydroxy-3(2H)furanones (I) which are useful as flavouring substances. In an example (III; $R_1=R_2=$ Me) was prepd. in 96% yield by addn. of MeCH=CHCN to a refluxing soln. of ethyl lactate and NaH in THF. 10.8.78 as 032936 (6pp478).

NIOF ★ D13 14640B/08 ★J5 4004-906

Hard butter and highly stable liq. oil prepn. - by hydrogenating fatty oil, precipitating, emulsifying, sepg. into two portions and forming prods.

NIPPON OILS & FATS KK 15.06.77-JA-070776

(16.01.79) A23d-05 C11b-07

Fatty oil which is liq. at ordinary temps. is hydrogenated so that the content of trans-acid becomes 50-65%, and crystals are pptd. by tempering. It is emulsified by the addn. of aq. alkali soln. and sepd. in two portions of crystalline matter and non-crystalline matter, and the former is made into hard butter and the latter is made into highly stable liq. oil.

The catalyst for hydrogenation comprises 0.003-0.006 wt.% of methionine and 0.05-0.2 wt.% of ordinary hydrogenation catalyst, or 1-2 wt.% of sulphur-poisioned Ni catalyst is added to fatty oil. Liq. fatty oils contain no satd. triglyceride. Hydrogenation is carried out at 170-220°C under 0-2.5 kg/cm^2 of H_2 pressure.

Hard butter and highly stable liq. oil are prepd. by the sepn. of liq. fatty oil entirely without the use of solvent such as MEK acetone and nitropropane. Hard butter of high quality for the use of chocolate making, and highly stable liq. oil having high resistance to oxidation are prepd. in high yield economically. 15.6.77 as 070776 (8pp)

Mfr. of instant Shiruko (sweet red bean jam juice) - by mixing red bean jam with e.g. sugar alcohol, concentrating and drying

KANEBO KK 11.06.77-JA-069035

(16.01.79) A23g-03

The method comprises (1) mixing sugar alcohol and/or glycerin with raw red bean jam, (2) heat-concentrating the mixt. to impregnate sugar alcohol and/or glycerin in red bean jam particles and to decrease the moisture content to a prescribed level, (3) drying and powdering the mixt. to obtain dry red bean jam and (4) adding sweetener and opt. viscosity-increasing agent.

Instant 'shiruko' which can be easily restored with cold water or warm water to 'shiruko' excellent in texture and taste and flavour, can be prepd. 11.6.77 as 069035 (6pp5)

KANE ★ D13 14729B/08 ★J5 4005-062

Sugarless chewing gum - contg. starch hydrolysate, flavourant e.g. fruit extract, and chewing gum base

KANEBO KK 11.06.77-JA-069034

(16.01.79) A23g-03/30

Chewing gum is prepd. by kneading a mixt. of (a) a powder obtd. by coating a tasty substance e.g. juice and/or flesh of various fruits, coffee extract, black tea extract, extract of medical herb, etc. with the starch hydrolysate of DE 7-15 and/or its reduced product, (b) an aq. soln. of the starch hydrolysate of DE 7-15 and/or its reduced prod. and (c) chewing gum base as the major components.

Chewing gum shows low sweetness and good texture and is free of stimulative taste, foreign taste and odour. Its taste and flavour are durable and highly preservative. 11.6.77 as 069034 (5pp5)

AJIN ★ D13 14730B/08 ★J5 4005-068

Hygroscopic powdery seasoning prepn. - by hydrolysing potato protein, removing insol. material and drying opt. after refining

AJINOMOTO KK 10.06.77-JA-068643

(16.01.79) A23l-01/22

Seasoning is prepd. by hydrolysing potato protein, removing insolubles from the hydrolysate and opt. refining and drying.

The powdery seasoning prepd. is as tasty as the hydrolysate of soybean protein or of wheat gluten and is superior to them in softness and taste. It is slightly hygroscopic and can be handled conveniently. By combining it in conventional hygroscopic seasoning prods. their hygroscopic property can be improved remarkably. 10.6.77 as 068643 (5pp5)

HAYB ★ D13 14731B/08 ★J5 4005-070

Alpha-glucosyl-stevioside sweetener prepn. - from a glucosyl-contg. sugar and stevioside using glucosyl transfer enzyme

HAYASHIBARA BIOCHEM 13.06.77-JA-069551

B03 E13 (D16) (16.01.79) A23l-01/22 C12d-13

The method comprises adding α-glucosyl-transfer enzyme to an aq. soln. contg. stevioside and a sugar contg. α-glucosyl gp. and reacting them to form α-glucosyl-stevioside.

Examples of α-glucosyl-sugar are maltose, malttriose, malttetraose, partial hydrolysate of starch, sucrose, etc. and examples of α-glucosyl-transferring enzyme are α-glycosidase, α-amylase, cyclodextrin-glucanotransferase, dextransucrase, etc.

The sweetness is good and is free from bitterness and astringency which are observed in stevioside. There is little after taste and the water solubility is remarkably improved. 13.6.77 as 069551 (20pp5)

MARU- ★ D13 14739B/08 ★J5 4005-099

Treating miso to improve handleability - by heating, mixing with aq. agar soln. at 50 degrees C and cooling to coagulate the agar

MARUKOME MISO KK 10.06.77-JA-068543

(06.01.79) A23l-01/20

The properties such as viscosity, form-holding property, etc. of miso prepd. in usual way are improved by heating miso to 50°C, mixing aq. agar soln. (prepd. by dissolving agar in prescribed amt. of water, boiling and cooling to 50°C) with the miso, filling the mixt. in vessel and coagulating the agar by cooling.

The prod. can be easily handled with a spatula. 10.6.77 as 068543 (3pp5)

FARB D13 25481T/16 =J7 9001-699

Pure 2-hydroxydiphenyl prepn. - by fractional distillation followed by recrystallisation

Dried tea cutting machine - has rotor with longitudinal semicircular channels and radial slots into which working edges of cutting knives fit
GEOR FOOD IND RES 12.04.76-SU-347208
(17.04.78) A23f-03

Machine for cutting dried tea, comprising a rotor mounted on a drive shaft. On the surface of the rotor are longitudinal semicircular channels and radial slots, plus knives, the working edges of which are located opposite the radial slots and insert into them.

Cutting effectiveness is increased and conversion of the tea into powder is prevented by immovably mounting the knives above the rotor on two spindles, positioned parallel to the rotor shaft. One of the spindles is fixed by a joint and the other is spring-loaded.

Animal feed manufacture - based on grain, urea and other additives, by rapidly raising and lowering pressure at known temperature levels
KUIB MOTOR CONS WKS 03.03.76-SU-331393
C03 (17.04.78) A23k-01

Animal feed additives mfr. based on grain and urea, to produce carbamide-type concentrates for ruminant animals. The ingredients are treated under continuously-increasing pressure up to 14-60 atm. with periodical increase to a value relative to its initial value, and instantly reducing the pressure to atmospheric at the end of the treatment process.

The quality of the additives is increased, together with the productivity, by additionally subjecting the feed to cyclically-varying pressure from 1-5 atm. with a frequency of 2-10 Hz. Prior to the end of the process the pressure is previously reduced to 9-20 atm. The periodic increase of the pressure value is carried out for 5-10 sec. at 10-30 atm., over a period of 0.5 to 3 secs.

*(D16) (15.08.78) *BE-859-635 A23j-03*

Functional protein is prepd. by subjecting impure natural protein of whey, microbial or vegetable protein to temp. of 40-150°C in aq. medium until ≥ 50% ultimate protein capable of pptn. occurs% separating the ppte. from the medium; and treating the ppte with proteolytic enzyme at 20-65°C for < 30 mins. to achieve soln.

The enzyme is deactivated, being employed at a level, per gram of sepd. protein on a dry basis, of ≥ 240 HUT where enzyme is microbial and protease, ≥ 300 PC where enzyme is microbial neutral protease, ≥ 2300 Delf units where enzyme is microbial alkaline protease, ≥ 130,000 N.F PU where enzyme is plant protease, and ≥ 150 Pepsin units where enzyme is animal protease. Impure protein is such that in aq. medium a soln. of suspension is formed, suspension being hazy or clear after proteolysis.

Protein is used in a wide variety of food compsns., as a supplement or substitute for non-fat dry milk, sodium caseinate, gelatin and egg albumin. 13.10.76 as 732018 (10pp931)

USSA ★ D13 15662B/08 ★US 4107-335

Freeze-dried salad dressing - contains a high proportion of salad oil and is reconstitutable with water to a spoonable prod.

US SEC OF THE ARMY 08.04.77-US-785804

(15.08.78) A23l-01/24

A freeze-dried salad dressing is produced from a compsn. comprising (by wt.) 20-40.6% vegetable salad oil (I); 0.14-0.16% CMC-modified microcrystalline cellulose powder (II); 4.8-7.9% pregelatinised starch (III); 1-3.1% unmodified food starch (IV); 4.9-7.1% egg yolk solids (V); 1.9-2.1% dry synthetic vinegar (VI); 0.3-0.6% hot water-soluble gum (VII); 9.9-10.1% sugar (IX); 1.9-2.1% salt (X); 0.9-1.1% dry powdery spice (XI); 0.14-0.19% nonionic surfactant (XII) and 33.5-45.5% water.

(III) and (IV) are first mixed to form a dry blend and 80-90% of the water is added to form a slurry. This is then heated to 85-88°C for 10-15 mins. to form a translucent mass while adding water to make up evapn. losses. The remaining 10-20% water is divided into 2 portions, the first of which is added to (II) to form a paste and the second of which is added to (VII) to form a suspension which is then heated for 10 mins. at 100°C to produce a soln.; (IX), (X), (V) and (XI) are then mixed and added to the paste, this is added to the translucent mass and the total is mixed at 85-88°C in a vertical cutter mixer for 2 mins. at a low speed and for 2-3 mins. at a high speed while adding (XII) to (I) so as to form the salad dressing. The latter is spread on trays to a depth of 1-1.5 cms and blast-frozen for 3-4 hrs. It is then freeze-dried for 20-24 hrs. to a moisture content of ≤ 2 %, coarsely ground and then mixed with (VI).

The dressing is available as a free-flowing powder which is easily reconstitutable by the addn. of water into a spoonable compsn., or used as such for sandwich spread. 8.4.77 as 785804 (5pp922)

Corn popper with annular trough collecting popcorn - surrounding cooking pot with floating lid

DE WEESE R M 24.02.77-US-771761

(13.02.79) A23l-01/18

A corn popper includes a heated pot with a stirrer and a flexible lid. Initially the lid is closed but popping corn raises the lid and allows the corn to fall into an annular trough. The inner walls of the trough are formed by an annular shroud which is beneath the pot and includes apertures through which air is blown. An open topped storage bin fits over the trough and has an apertured lid for removing moisture laden air during popping.

The apparatus pops corn which is collected in the trough. After cooking, the trough and storage bin are lifted from the appts. together with the cooking pan and are inverted. Popped corn is held in the storage bin until required. Salt may be added to the corn while in the storage bin. 24. 2. 77 as 771761 (7pp295)

Strawberry dressing machine - with buoyancy pressing floating fruit up against inclined contra-rotating plucking rolls (NL 17.1.78)

KEWPIE KK (KEWP-) 29.10.76-JA-129383 (15.07.76-JA-083494)

*+P28 (13.02.79) *DT2729-366 A23n-15/02 +A47j-21*

Appts. for removing calyxes from fruit comprises a tank containing water to which the fruit is fed and directed down-wards by a conveyor before being released to float upwards to impinge on the lower end of an inclined system of rollers. This roller system consists of several pairs of rollers with metal core shafts covered with soft outers (e.g. sponge rubber) and disposed parallel and in contact; the system is inclined upward within the tank away from the fruit supply station.

Each pair of rolls is driven to rotate in opposite directions so that their contact surfaces move upwards. The calyxes of the berries are caught between pairs of rolls, clamped and plucked off. Appts. achieves high yield. 24. 6. 77 as 809932 (19pp1364)

Dietetic granular albumin food prod. - prepd. by mixing curdled milk casein granulating and drying

MERCK PATENT GMBH 20.08.76-DT-637426

*(13.02.79) *BE-857-948 A23j-01/20 +A23c-19*

A granular dietetic foodstuff is produced by incorporating 2-5 parts of casein into 6 parts moist milk curds, allowing mixt. to stand for time sufficient to bind the excess water in curds by swelling of casein, whereby formation of granulated and dried prod. is facilitated compared to milk curds alone.

Pref. starting curds have moisture content of 65-85%. Granular mixt. of curds and casein is dried to moisture content of 12-20% in first step, then to 3-8% in second step. Curd and casein mixt. is granulated to cylindrically shaped particles with size 0.5-5 mm, or dia. 0.5-2 mm and length 1.5-5 mm. Dried granules are coated with digestible protective coating. Curds to casein ratio in dried prod. are 1:1-5.

Granulated particles are esp. compact and firm, lowering rate of decomposition in digestive tract, slowing resorption and prolonging feeling of satiation. 12.8.77 as 824194 (3pp931)

Cottonseed meats are treated to separate intact the pigment glands and to produce a protein-rich flour concentrate.

The process comprises (i) dry disintegration of unextracted dry meats; (ii) forming a slurry in a non-polar solvent; (iii) comminuting; (iv) feeding the slurry through $\geqslant$ 3 cyclonic separations to obtain an overflow and an underflow from each separation; (v) recovering the protein-rich flour concentrate from the first overflow; (vi) recovering the first underflow contg. solids comprising coarse cottonseed meats; (vii) returning the coarse meats to the first separation; (viii) returning the overflow of each subsequent separation to the immediately prceeding separation; (ix) directing the underflow from each separation, except the last to the next separation and (x) directing the underflow from the last separation to a high gossypol content meal recovery operation. 8.9.76 as 721203 (10pp974)

SELE- ★ D13 15913B/08 ★US 4139-647

Fruit or vegetable puree prodn. under anhydrous conditions - where the peel is only removed after enzyme inactivation and maceration of the comminuted prod.

SELECTIVE LICENSING 04.10.77-US-839199 (29.10.76-US-736879)

(13.02.79) A23l-01/20

Fruit/vegetable puree is produced by continuously passing a dry inert gas at 280-300°F through a chamber, introducing an unpeeled fruit/vegetable into the chamber, hot slicing with knives preheated and maintained at 250-400°F to pieces having a min. dimension of $^1/_8$ - $^3/_{16}$'' to a max. dimension of $\frac{1}{2}$-$1\frac{1}{2}$'', maintaining the sliced prod. in the chamber for sufficient time at > 180°F to inactivate enzymes in it, macerating it and finally separating the puree from the peel and fibre.

By slicing to relatively large pieces, peel removal is facilitated in the final stage. By not removing the peel initially, enzyme activity is not initiated prior to introduction of the fruit/vegetable into the chamber system. This gives a puree of improved colour and freer of flavour deterioration. The peel/fibrous by-products may be incorporated into natural foods. 4.10.77 as 839199 (4pp922)

CAMP ★ D13 15914B/08 ★US 4139-648

Dense, textured protein prod. mfr. - by extruding protein dough as sheet below texturing temp., then heating surface, pref. in steam, before cutting

CAMPBELL & SONS LTD 31.10.77-US-846823

(13.02.79) A23j-03

The dense textured protein prod. is formed, with an unidirectional laminated surface structure, from a protein dough with a 60-73% solids content which is extruded as a sheet at a temp. below the point at which texturisation takes place. While it is being extruded both surfaces of the sheet are heated to texture them.

Extruded dough enters a treating chamber where a hot gas stream buoys up the sheet while it is further textured. On exit from the treatment chamber the sheet is cut into segments and these are fed to a second treatment chamber where the remainder of the prod. is textured. Finally the prod. is discharged from the second chamber against a controlled back pressure. 31.10.77 as 846823 (15pp295)

Pneumatic dryer for dispersing material - has spiral provided with rotating baffles made as pairs of opposing sections

PLANOVSKII A N 02.08.76-SU-389251

J08 Q76 (21.03.78) F26b-17/10

The dryer can be used in chemical, food and pharmaceutical industries. It contains a spiral which forms a rectangular cross section channel for the gas suspension. The channel outer coil is connected to the loader. The channel central coils which are provided with a rotating baffle are connected to the unloader. To improve the drying quality and increase the heat-mass transfer, the baffle is made as two pairs of sections placed opposite each other. One pair of sections radius is smaller than the last complete coil radius by three channel width. The other pair section is situated along the line connecting two circumferences which are between this coil and the first pair.

Liquid materials drying and agglomeration - using chamber with liquid atomisers whose nozzles are directed upwards

PROVISIONS EQUIP 03.11.76-SU-416582

J08 Q76 (21.03.78) F26b-03/12 F26b-17/10

The drying and aglomeration unit can be used in food, chemical and pharmaceutical industries for e.g. drying of milk. The unit contains a chamber with gas removal pipe and unloading arrangement, a vibrating gas supply box with gas distribution grid. The chamber contains atomisers with atomising nozzles for drying material. To reduce polydispersion and increase the drying quality, the atomiser nozzles are directed upwards. A cyclone is connected to the gas removal pipe. The cyclone unloading chute is connected to the chamber at the grid zone. An additional atomiser whose nozzle is directed downwards is placed above the unloading chute connection point.

Lyalin V.A., Kontorovich K.L., Risin A.P. et al. Bul. 13/5.4.78 3.11.76 as 416582 (3pp110)

Automatic pressure cooking system - separate electrically controlled steam generator operating only on demand and suffers less furring up
INNOVATIVE PATENT 15.05.72-US-253409 (18.01.74-US-434506)
*P28 +Q72 R59 (15.08.78) *US3818-819 +F22b-01/30 H05b-03/60*

An electroytic steam generator, used in a pressure cooking system, has a steam compartment housing a series of electrodes immersed in water and a control system including a normally closed solenoid operated water inlet valve. A time delay relay has a set of normally open contacts which are closed by an operating coil at a predetermined time after the time delay relay is energised.

A current relay has a set of normally closed contacts operated by a pick up coil and the normally closed contacts and the normally open contacts are connected in series with the solenoid across a voltage source. The operating coil is connected in series with the normally closed contacts so that, when the current supplied to the electrodes exceeds a predetermined value, the pick up coil opens the normally closed contacts.

The opening of the water inlet valve is delayed for a predetermined time following the time when the current supplied to the electrodes falls below a predetermined value. 6. 11. 75 as 069592 Div. ex 3818819 (+ 18. 1. 74 - US - 434506)(5pp1363)

Unit load chain conveyor partic. for continuous food steriliser - uses transverse carriers pivoted between single chains
YAMATO SCALE CO 22.06.76-JA-U82293
*Q35 (13.02.79) *FR2355-741 B65g-17/18*

Chain conveyor system carries pivotally mounted carriages suspended between the chains; the carriages are normally maintained in horizontal positions. A pair of horizontal rollers and a pair of vertical rollers fixed to the carriage sides engage fixed guides at suitable points to maintain the carriages horizontal whether travelling through horizontal, vertical or inclined paths. Pref. a revolving guide roller is pivoted to an arm attached to one of the supporting axles on the outside of the chain and engages a notch in a revolving guide wheel to maintain the carriage horizontal as it travels around a drive chain wheel.

The low cost chain conveyor system ensures that the carriages are maintained horizontal throughout. It is esp. useful in a continuous food sterilisation system in which airtightly packed foods are to be kept in a predetermined position during treatment. 4. 1. 77 as 756645 (8pp1364)

D15: WATER TREATMENT

CHUR- ★ D15 14192B/08 ★BE -869-847
Inhibiting lead corrosion in drinking water systems - by adding soluble carbonate and maintaining pH at specified level
CHURCH & DWIGHT INC 18.05.78-US-907280
E34 M14 (19.02.79) C02b C23f

The process comprises adding to the water a source of water soluble carbonate in an amt. necessary to assure the passivation of the pipes comprising lead contg. elements. The pH of the water is maintained at 7.5-9. Pref. the carbonate content, expressed as $CaCO_2$ is maintained at a minimal amt. of about 20mg/l. The water pH is maintained at 0. 5-9 in a manner to form a layer of lead carbonate to assure the passivation of the lead.

The process is partic. applied to drinking water, usually of lower pH and low carbonate content, which is corrosive to lead resulting in too high a lead content in the water (normal environmental limit 0. 05mg/l). The method is very effective whereas previous processes such as pH adjustment or adding orthophosphate are limitedly effective and ineffective respectively. 18. 8. 78 as 869847 (24pp597)

PVC tank contg. filter to purify rain water for storage - uses charcoal filter bed suspended in removable basket
GOIS J F 14.09.78-BE-870466
A92 (02.01.79) C02b

A filter tank for the purificn. of surface water etc. collected from roof gutters for cistern storage. Made of PVC and contains a filter bed, e. g. of plastic foam and/or charcoal. The filter bed, esp. that of charcoal is pref. contained in a perforated basket which is removably suspended inside the tank. The basket is interchangeable with a replacement contg. a fresh filter bed. The tank is pref. fitted with a dosing device to inject bactericide fluid into the water passing through the filter. 14. 9. 78 as 870466 (6pp)

GROT/ ★ D15 14204B/08 ★BE -871-091
Motorised rotary agitator to aerate liq. manure etc. - has blade passage outlets drawing air from atmos. via tubular drive shaft
GROTZ W 10.10.77-DT-745538
J02 (01.02.79) B01f

The blades operate below liq. surface level and each has a air outlet orifice in the trailing edge, near the outer tip of the blade. During rotation air is drawn to and through the orifice from atmos. via a pipe extending parallel to the axis of rotation of the shaft.

The agitator is pref. used for aerating liq. manure in which case the pipe passes up the inside of a tubular drive shaft. The blades are pivoted to collapse back against the shaft so that the rotor assembly can be passed through a sump top hole of small dia. blade collapse and erection are actuated via a mechanical linkage from the bell-cranked, inner end of each blade to the lower end of the pipe, by axial movement of the pipe controlled from above the surface.

The rotor can take the form of propellor for a boat. Air is drawn in by rotation of blades so no pump is required. Aeration speeds up the formation of aerobic bacteria so reduces the mfg. time of liq. manure. The process is simultaneously kept free of objectionable odours. 9. 10. 78 as 871091 (15pp448)

Toxic load control of sewage plant - by measuring oxygen demand difference between standard and actual mixture
BAYER AG 03.08.76-DT-634846
*R16 (15.02.79) *DT2634-846 C02c-01/06 G01n-33/18*

The process detects substances in sewage which hinder biological breakdown in a treatment works. The oxygen absorption of activated sludge from the works is measured with (a) a standard nutrient soln. and (b) with the sewage to be examined.

At regular time intervals, the oxygen absorption rates are measured of (a) a first mixt. of the activated sludge, synthetic sewage as standard nutrient soln. and drinking water, and of (b) a second mixt. of the same constitution as the first as regards sludge and soln. but with the drinking water replaced by the same quantity of sewage to be examined. The results are then compared. 3. 8. 76 as 634846 (6pp160)

NALC D15 50618Y/29 =DS 2647-341
Ozonisation catalyst for treating waste water - comprises ferric oxide deposited on active alumina
NALCO CHEMICAL CO 12.01.76-US-648133
*J04 (15.02.79) *DT2647-341 B01j-23/74 C02c-05/04*

An ironoxide ozonising catalyst is prepd. by impregnating gamma-aluminium oxide with an aq. soln. of a soluble ferric salt, drying at 104-177° C and then calcining at 510-566° C. The catalyst contains 1-20 wt. % ferric oxide and is useful to remove impurities, such as phenol and other organic impurities, from waste water.

The catalyst is efficient and retains its activity after use. 18. 10. 76 as 647341 (4pp068)

BATT ★ D15 14369B/08 ★DT 2735-301
Decontaminating waste waters contg. cyanide - by oxidn. to cyanate using solid, insol. redox system, e.g. a quinoid cpd
BATTELLE-INSTITUT EV 05.08.77-DT-735301
P35 (15.02.79) A62d-03

Cyanide-contg. waste water is decontaminated continuously or intermittently. In a 1st step, the cyanide is oxidised to cyanate with a solid, insol. redox system which is converted to the reduced form. In a 2nd step, the redox system is re-oxidised with air-O_2 and recycled to 1st step. Pref. redox system contains solid, insol. reversibly reducible quinoid organic cpds., (I), which are mixed with or absorbed on an active C having a large surface. An organic, polymeric binder for (I) can be used.

Addn. of chemicals is reduced. Salting of waste waters is prevented. High oxidn. capacity of (I) maintains a high reaction velocity also at low cyanide concns. Use of a solid, insol. system obviates need for control and measuring devices. The active C acts as re-oxidn. catalyst for (I) and provides a large reaction zone. 5. 8. 77. as 735301 (9pp200)

Caravan kitchen waste disposal - using buried cylinder contg. strainer and adsorbent cartridge before seepage to ground
WOTSCHKE M 05.08.77-DT-735327
(15.02.79) C02c-01

Kitchen sink waste from caravans is disposed of by a simple combination of sepn. and adsorption. The sink outflow is passed by a pipe into a water trap inside a buried cylinder. A detachable strainer retains food remnants and other coarse particles. The section below holds a throwaway cartridge with an adsorbent which extracts fats and detergents. The underflow is allowed to seep into the soil. A well sealing lid covers the cylindrical shaft and excludes smells. 5. 8. 77. as 735327 (4pp39)

KRUN ★ D15 14399B/08 ★DT 2736-256
Radioactive liquid effluent disposal by evaporation - in cooling tower esp. after preliminary treatment used esp. for regions with limited water
KRAFTWERK UNION AG 11.08.77-DT-736256
K07 (15.02.79) G21f-09/04

A method of disposing of radioactive waste water in a nuclear power plant equipped with a cooling tower consists of evaporating the waste water in the cooling tower. Pref. the water is first pretreated by one or more evaporation stages before it is evaporated in the tower.

The method is partic. applicable where a dry cooling tower is used, the evaporation of the waste water taking place intermittently, with intervening periods in which an activity-free flushing agent is injected into the discharge line.

In particular for a nuclear power plant in a region with a very limited water supply, e. g. a desert region. 11. 8. 77. as 736256 (6pp236)

WOLF ★ D15 14411B/08 ★DT 2736-651
Water-soluble basic polymer with polyethylene glycol units - used as retention aid and draining accelerator in paper mfr., waste liquor and sludge treatment
WOLFF WALSRODE AG 13.08.77-DT-736651
A97 F09 (A23) (15.02.79) C08g-59/10 C08g-69/48 D21f-01/70 D21h-03/02

The additive consists of a reaction prod. (C) obtd. by reacting an aliphatic polyethylene glycol (PEG) ether amine (A) with a basic polyaminoamide (B) and reacting the intermediate (AB) with polyfunctional cpds., pref. epichlorhydrin. (A) is formed by the action of aliphatic polyamine with the reaction prod. of a PEG with epichlorohydrin. (B) consists of polyalkyiene-polyamine(s) and/or aminocarboxylic acid(s) and/or their lactam(s) and/or hexamethylene-diammonium adipate. (AB) is formed by the elimination of H halide from the halogen gps. of (A) and the NH gps. of (B).

Additive is used for improving the retention of floatable solids, accelerating the draining of suspensions and treating industrial (waste) liquors and sludges more rapidly by adding aq. solns. of basic polymers.

It is esp. for use in the paper mfg. industry and is more efficient than usual, in spite of the presence of PEG units, and qualitative and quantitative variations in the structure can be used to suit the prod. to the intended application. 13. 8. 77. as 736651 (38pp016)

VARO- ★ D15 14435B/08 ★DT 2828-361
Biological surface water purificn. - by spreading and passing through water plant stock
VAROSEPITESI TUDOMA 04.08.77-HU-VA1507
(15.02.79) C02c-01/02 C02c-05

A purificn. system for surface water to remove diffuse contamination from fertilisers, detergents or other substances which encourage a eutrophisation of the effluent is based on biological principles. The surface water is spread out and the impurities dissolved in it are absorbed by water plants.

This prevents an accelerated eutrophisation of the water reaching the disposal system. The costs for installation and operation are low and require only unskilled labour. 26.6.78. as 828361 (16pp39)

GRIS/ ★ D15 14512B/08 ★FR 2390-992

Aerator for treating liquids - comprises turbo-agitator connected to air compressor giving air injection at turbine level, maximising efficiency with min. air consumption

GRISEY R J 18.05.77-FR-015415

J02 (19.01.79) B01f-05/16

A device for aerating liquids, partic. aq., comprises a turbo-agitator and a compressor. The compressor is connected to the turbo-agitator so that air is injected into the liq. at the level of the turbine. The device can operate intermittently, the time being a function of the characteristics of the turbo-agitator, the rate of air and the vol. to be aerated, or it can operate continuously.

Problems associated with existing appts. in which the air is introduced through a perforated plate, are avoided. These include large air consumption, lack of adaptability to vessels of different kinds and the risk of blockages. The appts. ensures intimate mixing of air and liq., giving optimum aeration with min. consumption of air. It can be adapted to any vessel and there is no risk of blocking with solids. 18.5.77 as 015415 (5pp1192)

MARL/ ★ D15 14522B/08 ★FR 2391-161

Tank for waste water purificn. by flotation and coagulation - with electrolytic or air-injection assistance; can be site constructed from prefabricated sections

MARLIERE Y G P 16.05.77-FR-017479

(19.01.79) C02b-01/82 C02c-01/26 C02c-05/12

The surface of the waste water is pref. skimmed by rotating, horizontal, radial blades which convey floating scum to a drain outlet. The tank is pref. constructed of prefabricated sections which can be assembled on site. Access panels or doors are pref. provided to facilitate replacement, servicing or cleaning of the electrolysis electrodes.

The tank is constructed on site from prefabricated sections as follows, sump truncated, pyramidical settlement funnel with scum drain inlet section with siphon and top frame with cross beams. Suitably an inlet pipe, electrodes a motor-driven skimmer and an outlet for purified water. 16.5.77 as 017479 (6pp448)

SADO/ ★ D15 14523B/08 ★FR 2391-162

Outlet valve from settling tank for waste water - uses remote controlled inflatable diaphragm to plug upward facing valve inlet

SADOULET M A A 18.05.77-FR-016067

(19.01.79) B01d-21/24 C02c-01/06

The valve comprises a discharge pipe with open end facing upwards beneath the water surface and spaced from the tank wall. A vertical, cylindrical, valve support, rigidly fixed to the tank, is suspended coaxially to extend partly into the open end of the pipe, leaving an annular valve passage between cylinder and pipe. A flexible diaphragm sleeve is end-clamped around the cylinder so that it can be inflated to plug the valve passage and deflated to re-open the passage.

Below the upper section of the pipe, which accepts the sleeved cylinder, the pipe dia. is pref. stepped down to less than the outside dia. of the cylinder. This means that vertical adjustment of the cylinder alters the effective cross-section of the valve passage to preset a max. flow-rate. The sleeve inflation is pref. remote controlled by supply pneumatic or hydraulic fluid via a tube passing down the inside of the cylinder.

Used partic in tanks in which waste water is purified first by activated sludge treatment and then sedimentation. The valve can be remote controlled to be fully sealed during treatment and settlement and then fully open for discharge. No sludge is retained in the pipe entry during value closure. The valve passage cross-section is adjustable. The valve creates no upflow which might disturb and entrain sludge. 18.5.77 as 016067 (8pp448)

SADO/ ★ D15 14524B/08 ★FR 2391-163

Air entrainment liq. jet aerator for purifying waste water - has angles and grooves in nozzle bore to intensify air liq. contacting

SADOULET M A A 17.05.77-FR-016047 (02.10.75-FR-030874)

(19.01.79) C02c-01/10

The jet is delivered from a nozzle above the surface of the water, the nozzle axis being inclined at an acute angle to the surface. Air is entrained into liq. passing through the nozzle via an open-ended pipe extending coaxially from the nozzle outlet, through the nozzle bore to atmos. The nozzle delivers an annular jet of liq. with entrained air which both agitates and aerates the waste water.

In this addn. the nozzle bore has a convergent zone which in longitudinal cross-section has a profile presenting a sharp, angular change of direction, partic. A re-entrant angle. The re-entrant angle is pref. formed at the intersection of a frusto-conical bore with a cylindrical outlet. The interior of the bore, partic. the cylindrical outlet, is pref. longitudinally grooved or channeled. Pref. the exterior of the air pipe is also longitudinally grooved or channeled.

The sharp angle and grooves in the bore create intense contacting of air and liq. aeration efficiency is increased. 17.5.77 as 016047 Add to 2.10.75-030874 (6pp448)

Aerobic bacterial sewage treatment plant - is designed esp. for small scale use and includes auxiliary digester
CENTROX CORP (PEAS/) 04.08.76-US-711762
*(21.02.79) *US4036-754 C02c-01/02*

Apparatus for treating sewage by bacterial digestion is characterised by circulation of sewage in the treatment tank to prevent solids from settling while digestion is in progress and to facilitate removal of clarified effluent without recontamination by newly arriving solids.

The apparatus comprises a clarification compartment within the main treatment tank, an auxiliary digester compartment separated from the main tank by a weir, a device for periodically backflushing the contents of the clarification compartment into the main tank, and a device operative between each periodic backflushing to aerate and circulate the contents of the digester. The aerating device when not operating allows solids to settle leaving a supernatant liq. in the digester which is transferred to the main tank. 7.7.77 as 028482 (7pp1379).

ICIL ★ D15 14574B/08 ★GB 2002-248
Coalescing appts. for removing oil from oil-water emulsion - has rectangular coalescing plate movable so that emulsion flows in different directions through plate
IMPERIAL CHEM INDS LTD 05.07.78-GB-028888 (15.08.77-GB-034157)
H03 J01 (21.02.79) B01d-21/10 B01d-29/02

Appts. comprises a vessel through which the emulsion is passed upwardly and a drain at the bottom of the vessel. A rectangular oil coalescer located in the vessel is movable between two positions so that first one rectangular face and then the other rectangular face is at the underside.

Upward flow of emulsion through the coalescer is periodically interrupted to drain the vessel and cause a temporary flow reversal which removes solids from the coalescer. In addn. the coalescer is moved between its two positions so that its two rectangular faces are alternately on the underside.

Retained solids are periodically removed from the coalescer to prevent build up of hydrostatic pressure across it. This enables the hydrostatic pressure differential to be maintained at 3-10 psi so that the coalescer can be housed in an inexpensive vessel, e.g. of plastics. 5.7.78 as 028888 (6pp67).

UNIV ★ D15 14575B/08 ★GB 2002-250
Granular bed fluid filter - with upper fixed bed portion above lower fluidised bed portion of variable size, for hot gas cleaning and filtering municipal water
KANSAS STATE UNIV R 15.08.77-US-824840
J01 (21.02.79) B01d-46/38

Fine particulates are filtered from a fluid using a granular bed supported above a fluid inlet. A perforated plate movable to selected elevations is mounted above the bed to restrain the upper surface. A fluid to be filtered is passed upwardly through the bed at a velocity at least twice the min. fluidisation velocity of the unrestrained bed. A cake of particulates is collected in the bottom of the bed while maintaining the remaining upper part of the bed as a fixed non-fluidising bed.

The plate is raised progressively to form a fluidised bed portion of gradually increasing size below an upper fixed bed portion while continuing to pass the fluid through the bed. The collected particulates are retained as a cake in the fixed bed portion and as circulating solids in the fluidised bed portion. At the conclusion of the filtration process the plate is raised above the bed to provide a freeboard space and a purging fluid is passed through the bed to fluidise it and sweep the particulate from it.

Most of the filtered particulates are retained in the fluidised bed portion and a uniform pressure drop can be maintained across the fixed bed portion. 11.8.78 as 033040 (9pp67).

Water filter basin bottom duct - with intercommunicating longitudinal passageways for inward filtrate and outward backwash and purge air flows
MITSUI SHIPBUILDING ENGG 12.08.77-JA-U07841
J01 (21.02.79) B01d-23/20 B01d-35

A duct for location under gravel and filter layers in a water purificn. bed comprises a longitudinal partition forming two passageways which intercommunicate via one or more apertures in the partition and each communicate with the exterior through wall openings, with all water exiting the openings flowing in the same direction.

There is pref. an upwardly converging central and two symmetrical side passageways in a rectangular section duct. Filtered water pref. enters the duct top to flow along all passageways, while for back-washing water is supplied to the central passageway and passes upwards into the bed after entering the side passageways. For air scouring of the bed, air is fed to the central passageway and exits its top. The duct is pref. of porcelain or plastics. 11.8.78 as 033093 (6pp1358).

Concentrating liquid waste, e.g. radioactive waste - in an appts. which vaporises the water under vacuum and adds hardener to harden the conc. waste
MITSUBISHI HEAVY IND KK 15.06.77-JA-069956
A88 K07 (16.01.79) C02b-09 C02c-05 G21f-09

Liq. waste e.g. a radioactive waste soln., is stored in a reservoir. The liq. waste is fed through a vinyl pipe by a pump to a round bottom flask heated by a mantle heater. Steam is vaporised from the round bottom flask and fed through a valve to a cooler of glass cooled by cooling water. The steam is condensed by the cooler and introduced into a reservoir. The reservoir is connected to a vacuum pump and slightly exhausted thereby. The exhausted gas passes through a demister to remove the moisture content therefrom.

The concentrated liq. waste is left in the flask. Connectors are detached from glass pipes of an insertion plug and the insertion plug is then removed from the flask. A hardening agent is thrown into the flask to harden the concentrated liq. waste. The flask thus obtd. is discharged.

Thereafter, a new flask is placed on the heater. 15.6.77 as 069956 (4pp86)

The frames and gaskets are arranged so that the openings of each frame align with notches for electrical conduction of each gasket, and the notches communicate with liq. feed and drain holes bored through the gasket to distribute the liq. in the frame openings.

The structure used in a filter press-type electrodialysers for concn., desalination etc. of sea water, or removing electrolytes from soln. 17.6.77 as 071024 (5pp26)

NICH- ★ D15 14971B/08 ★J5 4006-346

Removal of scale-forming solids from water e.g. in boiler - by adding heat resistant enzyme then passing water through bundle of small porous pipes to remove solids formed

NICHIZO KK 16.06.77-JA-071399

(18.01.79) C02b-01/82 C02b-05/06 C02c-05/02 C23f-14/02

Heat-resistant enzyme is added to the water in a proportion of 0.5-5% as much as service water, and the service water is, while being used in the appts., passed through one or more porous small pipe bundles with a linear velocity near the upper limit of laminar flow in order to separate floating solids formed by means of the heat-resistant enzyme. The purified heat-resistant enzyme-contg. water obtd. is used as service water.

The porous small pipe is 6-13 mm dia. and 1-5.5 m long stainless pipe of sintered anticorrosive alloy powders of 0.1-1 µ bore size and the number of the pipe bundled is 1-61.

The method allows the treated water to be reused for service and is effectively applicable to the treatment of service water of all types without environmental pollution by discharged sludge. 16.6.77 as 071399 (5pp117)

YOKO- ★ D15 14972B/08 ★J5 4006-348

Water purificn. to remove and recover impurities - by precipitating impurities with iron hydroxide, adsorbing ppte. on magnetic iron oxide particles and subjecting water to vapour phase sepn.

YOKO YAKKA KOGYOSHO (NIES) 14.06.77-JA-070891

J01 (18.01.79) C02b-01/23 C02c-05/02

Removal and recovery of harmful substances e.g. arsenic, hydrogen, sulphide, silicic acid, etc. from water, comprises (a) adding a ferrous salt to water followed by an alkali to cause coprecipitation of the harmful substances with iron hydroxide, (b) adsorbing the coprecipitate with magnetic iron oxide particles for removal, (c) adding a mineral acid to the sepd. ppte. to dissolve iron hydroxide and silicic acid present, (d) subjecting arsenic, hydrogen sulphide, etc. present in the water to a vapour-phase sepn. process, and (e) where finally obtd. water contains silicic acid, removing the silicic acid by pptn.

The method can continuously, effectively and rapidly treat water in great quantities using a closed system at a low running cost. The treated water can be reused for agriculture, industry, drinking and other purposes. The iron hydroxide can be easily removed from the magnetic iron oxide particles for reuse, and the arsenic and hydrogen sulphide can be recycled by using adsorbers. 14.6.77 as 070891 (6pp117)

TAKG ★ D15 14973B/08 ★J5 4006-349

Water treating agent for fluorine-contg. waste water - comprises aluminium or basic salts of mono:basic acid contg. phosphoric acid and calcium

TAKI KAGAKU KK 15.06.77-JA-071275

A97 E33 (18.01.79) C02b-01/23 C02c-05/02

The agent comprises the aluminium salts or basic salts of a monobasic acid contg. phosphoric acid and calcium in the Al/PO_4 molar ratio of 2 to 5 and a Ca/PO_4 molar ratio of 2 to 5.

Pref. the Al salts used include aluminium chloride or aluminium nitrate, and the basic salts used include basic aluminium chloride or basic aluminium nitrate. The pref. amt. of water-treating agent used is 10-5000 ppm on the basis of Al_2O_3. To enhance settling of sludge, other coagulants, e.g., polyacrylamide, aluminium sulphate, lime, organic high polymer coagulants, etc. can he used.

The agent simplifies maintenance and the use of a much smaller settling tank due to the higher precipitations action of the flock formed in the water treatment and lowers operational cost due to a redn. in sludge formation by 1/3 to 2/3 compared with conventional methods. 15.6.77 as 071275 (4pp117)

CHIY ★ D15 14974B/08 ★J5 4006-351

Denitrification of waste water - using microorganisms and neutralising alkaline substances formed with carbon di:oxide or waste gas contg. it

CHIYODA CHEM ENG CO 15.06.77-JA-069980

(18.01.79) C02c-01/02

In the denitrification in which nitrates and nitrites in the waste water are reduced to nitrogen gas using microorganisms the alkaline substances formed are neutralised by injection of CO_2(-contg. waste gas) inorder to maintain microbial activity unaffected. Injection of CO_2(-contg. waste gas) is to a pH of 7 to 10.

In a test using artificial waste water contg. approx. 3,000 ppm nitrate nitrogen was treated by blowing in CO_2 at a rate of 8 l/hr. in the presence of approx. 10,000 ppm MLV SS of microorganisms at pH 7.5 to 8.0 and a water temp. of 30°C, the nitrate nitrogen was removed at an average rate of 0.33 kg-N/kg-MLV SS/D until a level of 1 to 2 ppm was attained.

The method is highly efficient, safe and pollution-free and is esp. for waste water produced in the treatment of flue gas. 15.6.77 as 069980 (3pp117)

TEIJ ★ D15 14975B/08 ★J5 4006-353

Treating waste water contg. emulsified oil - using an agent contg. 10-30 C fatty acid

TEIJIN KK 16.06.77-JA-070442

H05 J01 (18.01.79) B01d-15 C02c-05/02

In the treatment of waste water contg. emulsified oils formed by cationic surfactants, e.g. discharged from machine shops, chemical, petroleum, iron and steel making, food, paint and textile industries, etc. as agent contg. a 10 to 30C fatty acid is used.

Pref. 10 to 30-carbon fatty acids includes aliphatic saturated monocarboxylic acids, e.g., capric acid, lauric acid, palmitic acid, stearic acid, etc., aliphatic unsatd. monocarboxylic acids, e.g., elaidic acid, erucic acid, etc., and aliphatic dicarboxylic acids, e.g., sebacic acid, etc.

The method reduces the oil concn. to below 5 ppm, or to an extent such that even the n-hexane extn. method fails to detect it. 16. 6. 77 as 070442 (6pp117)

KAWJ ★ D15 14976B/08 ★J5 4006-354
Treating waste water contg. suspended solids - by flotation sepn. using coagulant, and blowing in carbon di:oxide
KAWASAKI HEAVY IND KK 16.06.77-JA-070491
(18.01.79) C02c-05

Carbon dioxide gas is blown into a blow-in tank in which the upper supernatant liquor from a aeration-flotation sepn. tank is housed. Suspended solids and emulsified suspensions are sepd. from the accompanying coagulant and then concentrated to buoy up, which is sepd. as a dehydrated recovery liquor. The remaining waste water contg. coagulant and CO_2 is sent to a coagulant-dissolving tank, where the waste water is supplementarily supplied to a coagulant and mixed with remaining waste water. The resulting waste water is then sent to the aeration-flotation sepn. tank, where the dissolved CO_2 is released by aeration to separate the upper supernatant liquor contg. suspended solids and emulsified suspensions with coagulant and the lower treated waste water, the lower treated waste water is discharged to outside as it is. The upper supernatent liquor is sent to the CO_2 blow-in tank. The dehydrated recovery liquor is sent from the CO_2 gas blow-in tank to a natural flotation sepn. tank for treatment.

The method has a great power to enhance coagulating effect and flotation sepn. effect in virtue of CO_2. Specifically, coagulant used as 3 ppm of $(AlCOH)_3Cl_3$ and 5 ppm of an anionic high polymer. 16. 6. 77 as 070491 (3pp117)

Test paper for micro-determn. of metals in waste water etc. - prepd. by treating mono:aldehyde cellulose based paper with alkali pretreated amino-di:hydro benzoxazinone and with diazotised amine
OSTROVSKAYA V M 21.09.76-SU-409051
J04 R16 (10.05.78) D21h-03/02 G01n-31/22

Reactive paper strips for rapid determn. of harmful metal ions (Zn, Cd, Hg, Cr, Cu etc.) in small concn. in aq. effluents and natural waters are prepd. by successively treating a monoaldehyde cellulose filter paper with an aromatic nitrogen-contg. cpd. and a diazotised amine. The metal-indicating, iono-selective properties of these paper strips are improved by using as an aromatic nitrogen-contg. cpd. 2-amino-2,3-dihydro-1, 4-benzoxazin-3-one. This cpd. is preliminarily treated with an alkali and then neutralised to pH 4-6.

A water pot with an electrolysing device is provided with a handle and the pot body includes an electrolysing vessel having a removable hollow, porous partition member mounted on support surfaces in the vessel.

The partition member is insertable into the vessel through a top opening in the water pot and is mountable in the vessel in water-proof relationship at the support surfaces to divide the vessel into two chambers.

One of the chambers contains a negative electrode, the other chamber a positive electrode, and water is removed from the positive electrode chamber after an electrolysing operation.

The opening in the water pot has a detachably mounted cover which includes two flow paths communicating respectively with the two chambers. Water is removed from the positive electrode chamber through a three-way valve for selectively communicating the two flow paths with a nozzle in the pot body which is in communication with the negative electrode chamber. 24. 11. 76 as 744706 (12pp 1363)

Controlling filtrate quality from filter - by passing side-stream of filtrate through monitoring filter

CONTINENTAL OIL CO 28.09.77-US-837117

_J01 (15.08.78) B01d-23/24_

The quality of filtrate from a filter is controlled by removing a sidestream from the filtrate which has passed through the main filter and passing it at a constant flow rate through a backwashable monitoring filter of appropriate pore size. The pressure drop over the monitoring filter is determined to provide an indication of the quality of the filtrate stream and the main filter is replaced or regenerated when the pressure drop reaches an unacceptable level.

Used for filtering swimming pool water and drinking water.

High accuracy is achieved. Only previously filtered material is monitored and the pressure drop is not subject to fluctuations liable to occur in streams of large vol. 28. 9. 77 as 837117 (5pp67)

A device for clearing a screen located in a water conduit (e. g. a sewer) includes a screen comb mounted at one end of an arm of a screen rake which can be moved from an intermediate position above the water level in the conduit to a position in engagement with the screen. The rake is moved to a position above a collecting bin where the screen comb is tilted about a horizontal axis to dump its carried screenings. A drive mechanism is connected to the rake arm for pivoting the arm and moving it in a vertical plane downstream of the screen.

The drive mechanism includes a continuous chain which runs over stationarily mounted deflection chain wheels, the chain comprising an endless chain of connected rollers movable over a stationary curved guide path positioned above and outside of the conduit. The rake arm comprises a two-armed lever having a pivot axle connected to the continuous chain and the rake arm is connected at one end through a swing bearing.

The screen rake is pivotably connected at the end opposite to the screen comb to one end of a hinged support which is pivoted around a stationary bearing and has a counterweight provided at the other end. 24. 5. 77 as 799920 (8pp1363)

Water purifying filter cartridge with by/pass - has conduit penetrating cartridge and selected by valves mating with cartridge

TELEDYNE INDUSTRIES 04.04.77-US-784420 (10.09.75-US-617449)

_(15.08.78) B01d-27/02_

A water purifier includes a filter cartridge enclosed within a housing which is supplied with water. The housing includes two valves which respectively deliver water to the filter element within the cartridge or to a bypass conduit. Water which has flowed through the filter or bypass is collected in a common manifold and discharged from a single aperture. The bypass conduit is integral with the filter cartridge and passes through the filter medium while remaining in liquid isolation. The upstream end of the cartridge has seats which mate with the flow-selecting valves.

The appts. filters domestic water. Operation of the valves directs the unfiltered water to the discharge aperture when filtered water is not required. This prolongs the life of the filter. 4. 4. 77 as 784420 (16pp295)

Appts. for oxygenating a thermally stratified body of water, such as lakes having a depth exceeding 8-10 metres, includes means for air treatment of the lower and colder hypolimnion layer without causing destratification. The appts. includes an air-entrapping bell-shaped housing having inner and outer shells moored to the bottom of the water to maintain the shells buoyantly at a predetermined distance above the bottom of the water.

The inner shell is open-ended and is surrounded by the outer shell having a closed upper end, both shells being wholly located in the hypolimnion. Compressed O_2-contg. gas is introduced into the lower end of the inner shell to effect oxygenation of the water by venting entrapped undissolved gas to the atmos. at a controlled rate to maintain a gas cushion at a predetermined pressure and volume. This produces undisturbed downward flow of the O_2-enriched hypolimnetic water within an outlet zone to inhibit flow of entrapped gas bubbles. 11. 2. 77 as 767882 C.i.p. 4060574 (+ 1. 6. 72, 21. 1. 75 - US - 258546, 551930)(10pp 1363)

*(13.02.79) *DT2639-836 B01d-21/26 +C02b-03/06*

Appts. for waste water purification by fluid filtration in sepg. zone ensures that the dropback by gravity of a portion of the suspension from the separating zone through the inlet aperture is completely avoided. The cross-sectional area of the inlet is less than 10% of the maximum cross-sectional area of either the separating or reaction zones.

A recirculation conduit extends from the upper separating zone, below the clear water discharge, to empty into the transversely swirling waste water in the reaction zone. The relatively high fluid flow at the recirculation outlet in comparison with the slow flow of waste water to the separating zone, and other conditions in the zone, cause the fluid pressure between the separating zone inlet and the recirculation outlet to drop. The suspension is automatically fed back to the reaction chamber via the recirculation conduit and the floating flocular bed remains undisturbed.

Optimum filtration action in a relatively small reaction vessel is provided. 22. 12. 77 as 863427 (3. 9. 76-US-720510) (9pp1364)

Removing unwanted slurried solids from reactor - oxidising sludge by pressurised wet process using heat exchanger
STERLING DRUG INC 27.12.77-US-864497
(13.02.79) C02b-01/34

A wet oxidn. system oxidises sludge which is pumped through a reactor together with pressurised air. A heat exchanger recovers heat from the reactor to preheat the sludge but after prolonged use an accumulation of slurries solids builds up within the reactor. The accumulated solids are removed from the reactor by substituting fresh water for the sludge inlet and directing this stream to the discharge conduit of the reactor but allowing the water to flow through the heat exchanger.

While this bypass is effective to back pressure on the discharge conduit is lowered while a drain conduit at the base of the reactor is opened. This drain conduit leads to the downstream side of the heat exchanger to mix slurried solids from the reactor with clean water to form a diluted cool effluent.

The plant is shut down for only a short period during removal of the solids. 27. 12. 77 as 864497 (4pp295)

Heat exchanger elements utilising solar energy - comprise horizontal plastics foils having intermittent welds, for simultaneous recovery of fresh water and salt
ELMQVIST O 27.07.77-SW-008598
A88 Q74 (22.02.79) C02b-01/06 F24j-03/02

D/S: (FR) E, (CH, DT, GB, LU) N, BR, SU, US.

Appts. for simultaneously recovering fresh water and salt or concd. saline soln. by direct collection of solar energy utilises heat exchanger elements each comprising two horizontally arranged foils. The foils are longitudinally jointed, e.g. by intermittent welding, to provide a plurality of longitudinal gaps for sea water transport.

Each element is attached mechanically at one end to inlets for sea water and at the other end to inlets for an evaporation chamber for recovering fresh water.

The foils are pref. made of a black plastics material which provides a high energy absorption capacity, low weight, cheapness and absence of corrosion problems. Large surfaces for solar radiation are obtained with little material consumption. The plastics material may be covered by a foil of transparent plastics material in order to reduce convection losses between the elements and ambient air.

17.7.78 as SW0022 (9pp1044).
ISR: US4010733; FR2308892; DT1517530.

UYMA- ★ D16 14223B/08 ★BE -871-171
Biological purificn. of waste water, fermentation of yeasts etc. - in reaction bed which controls effective vol. of biomass
UNIV MANCHESTER INT (SMHL) 20.10.77-GB-043615 (20.10.77-GB-043613)
B04 (D13 D15) (01.02.79) C12b

Installation is of the type in which a biological material is developed on a supply of suitable nutrients. The nutrients and any other necessary materials are passed through a porous bed in a reaction vessel. The bed comprises column type packing elements. Each element contains biological material in a cavity which has extensive openings to the surface of the element.

As the biological material grows in each element it is not allowed to extend beyond the surface of the element. This limitation of volumetric growth can be carried out continuously or periodically pref. by agitation and inter-element friction produced by liq. flow through the bed, e.g. flow of inutrient etc.

Used for purificn. of waste water and industrial effluent by the activated sludge process; biological fermentation processes for the prodn. of single cell protein, such as yeasts, e.g. for the beer brewing industry; and the prodn. of pharmaceuticals. The volume of the biomass in the reaction vessel can be precisely controlled. The concn. of biomass can be kept at optimum level. The elements can be taken from the vessel, cleaned and re-used. 11.10.78 as 871171 (17pp448)

Rotting silo charging system - with reversible scraper distributor conveyors under feeder trough conveyor
RIETZ E 28.07.77-DT-734050
_(15.02.79) C05f-09/02_

A charging system for rotting silos includes an endless trough-type feeder conveyor above several distributor conveyors at right angles to it. The distributor conveyors fill the silo from the centre towards the sides at one half. Their direction of motion is reversed when one half of the silo is full.

This charging system requires a minimum of energy and ensures that all layers of rotting material have the same density. Spaces over which there are no distributor conveyors can be utilised for staircases or lifts. 28.7.77 as 734050 (9pp39)

CALP- ★ D16 14419B/08 ★DT 2819-035
Antibacterial protein C-3603 - from Streptomyces mutans C-3603 for preventing oral infections esp. dental caries
CALPIS FOOD IND 28.07.77-JA-089790
_B04 (15.02.79) A61k-07/26 C07g-17 C12d-13/02_

New antimicrobial substance C-3603 (I) is produced by cultivating a certain species of the genus Streptococcus in a medium and isolating C-3603 from the resulting culture medium.

(I) has specified physical and chemical properties 6000-10000 (SDS polyacrylamide gel plate electrophoresis); (b) decomposition point 190-195°C; (c) UV absorption maxima at 280 nm ($E_1^1 = 33$); (d) IR absorption bands at 3290, 1650, 1535, 1240, 1105 and 733 cm^{-1}; (e) slightly soluble in aqueous acid (pH 3.0), practically insoluble in water, insoluble in MeOH, EtOH, acetone, ether, ethyl acetate, $CHCl_3$, n-hexane and benzene; and (f) positive colour reactions with ninhydrin, biuret; xanthoprotein and Adamkiewicz reagent.

C-3603 has high antibacterial activity against a number of gram-positive bacteria, esp. cariogenic bacteria in oral cavities. It is therefore useful for inhibiting oral infections, esp. dental caries. MIC's of C-3603 are 6.25 mcg/ml against Streptococcus sanguis ATCC 10557, 50 mcg/ml against Lactobacillus brevis AHU, 6.25 mcg/ml against Bacillus subtilis ATCC 6633, 6.25 mcg/ml against Staphylococcus aureus IAM 307, and>100 mcg/ml against E. coli. 29.4.78. as 819035 (32pp280)

AIRP ★ D16 14434B/08 ★DT 2827-474
Biomass with high phosphorus and nitrogen content - for use as fertiliser, animal feedstuff and as high-energy biomass for the fermentation industry
AIR PRODUCTS & CHEM INC 25.07.77-US-818786
_C03 (C04 D13) (15.02.79) A23k-01 C05f-07 C12d-03 C12d-13_

Biomass with high nitrogen and phosphorus content is produced by (a) forming a mixed liquid by mixing activated biomass with nitrogen-, phosphorus- and BOD-contg. feed under anaerobic conditions so that it is essentially free from NO_x^- and has a dissolved oxygen content of < 0.7 ppm, by which means there is effected a selective production of non-filamentous microorganisms which are capable of sorbing BOD under anaerobic conditions.

Process further comprises (b) oxidising BOD in the mixed liquid by contacting with O_2-contg. gas under conditions such that a dissolved oxygen content of ≮1 ppm is maintained; (c) allowing the oxidised mixed liquid to settle in order to separate a supernatant liq. from a denser biomass; (d) using a part of the separated biomass as activated biomass for mixing with further BOD-contg. feed; and (e) recovery of the remainder of the settled and sepd. biomass as the prod.

The biomass produced can be used as fertiliser, as an animal feedstuff, or as a high-energy biomass for the fermentation industry. When used as a fertiliser, the biomass is particularly advantageous, since both the phosphorus and the fixed nitrogen content are available to plants; since the nitrogen is mainly in the form of protein and the phosphorus is largely in the form of polyphosphate, the prod. has slow-release properties. 22.6.78. as 827474 (31pp280)

Fixing enzyme or microbial body with betaine polymer - giving a gelled prod. without fall in enzymic activity, for use with almost all kinds of enzyme

NITTO BOSEKI KK 14.06.77-JA-070214

A96 B04 (16.01.79) C07g-07/02 C12k-01

The method comprises radical polymerising betaine-type crosslinking monomer (I) $(CH_2=CR-CH_2)_3-N^+-(CH_2)_nX^-$ in aq. medium contg. enzyme or microbial body, or by radical copolymerising (I) with ≥ 1 monomer selected from betaine-type noncrosslinking monomer $(CH_2=CR-CH_2)_2-N^+(R')-(CH_2)_mX^-$ and nonionic water-soluble non-crosslinking vinyl monomer in an aq. medium contg. enzyme or microbial body. In the formulae, each R is H or Me; R' is 1-20C alkyl or aralkyl; X is $-SO_3$ or -COO; n = 1-200; and m = 1-20.

The enzyme or microbial body is included in a gel composed of a polymer which shows strong affinity for the enzyme; the fixed enzyme keeps its enzymic activity stably for long periods and can be obtd. without fall in enzymic activity. The method can be used for almost all kinds of enzymes, e.g. catalase, glucoseoxidase, D-aminoacid-oxidase, L-aminoacid-oxidase, α-amylase, β-amylase, arginase, cholinesterase, β-glucuromidase, invertase, lipase, pepsin, peroxidase, ribonuclease, tripsin, urease, etc. 14.6.77 as 070214 (13pp5)

Fixed glucose-isomerase prepn. - by aggregating suitable microorganism with chitosan, a water-insol. phosphate being added in the process

TOYOBO KK 13.06.77-JA-070356

(D17) (16.01.79) C07g-07/02 C12k-01

Prepn. of fixed glucoseisomerase (I) comprises aggregating (I) producing microorganisms bodies with chitosan, where a phosphate which is difficultly soluble in water or aq. alkali is combined with the fixed (I) at an optional stage.

By adding the phosphate, the pH drop of the isomerised soln. at the initial or final stage can be prevented and being kept at optimum pH range, the fixed (I) can maintain high activity throughout the isomerising process.

Suitable microorganisms are from Streptomyces, Bacillus, Arthrobacter, Pseudomonas, etc. and they are dispersed in buffer soln. of pH 5-7 to 0.5-40 wt.% concn. The dispersion is mixed with the chitosan soln. which is obtd. by dissolving 0.1-1.0 wt.% chitosan in aq. acidic soln. As the phosphate, magnesium hydrogen phosphate, calcium metaphosphate, magnesium pyrophosphate, etc. can be used in amts. of 1-20 wt.% w.r.t. solids of the microbial body. 13.6.77 as 070356 (4pp5)

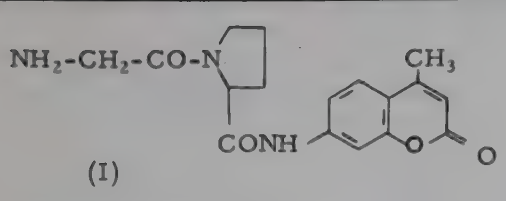
B04 E13 R16 (B02) (17.01.79) C07d-405/12 G01n-31/14

7-Glycylpropylamino-4-methylcoumarin is of formula (I). (I) is useful as



(I)

fluorescent substrate (intermediate) for measurement of enzyme activity and with the use of (I), highly sensitive measurement of enzyme activity is possible. (I) is prepd. by reacting N-protected-glycyl proline with 7-amino-4-methyl coumarin in the presence of organic base such as amine and condensation agent with the use of a solvent such as DMF, etc., followed by removing the protecting gp.

In an example, N-carbobenzoxyglycyl-L-proline and triethylamine in THF are added to chloroisobutyl formate and 7-amino-4-methyl courmarin then added. The resultant is distilled, washed and chromatographed to give 7-(N-carbobenzoxyglycyl-L-prolyl)amino-4-methyl courmarin. Catalytic reduction with Pd-C and H_2 gas gives (I). 16.6.77 as 071469 (5pp22)

Fermenter fluid aerating turbine - has flow dividers along periphery in annular nozzle between discs to improve heat and fluid circulation
N CAUCASUS PROTEIN 11.08.75-SU-163872
(20.04.78) C12b-01/14

Improved mass heat exchange is obtd. when stirring and aerating fluid fermenters have flow dividers between the outside surface of the turbine and the discs. The unit is attached to the drive shaft and its throat connected to the air conduit.

The fluid is impelled through the holes of the discs for uniform ejection through the annular nozzle resulting in a partial vacuum inside the turbine. And this causes air suction from the atmosphere for mixing with the fluid in the annular nozzle. The flow dividers along the turbine periphery with sharp edges facing the incoming fluid give rise to microjets reducing the resistance to oxygen transfer on account of shear strains.

Device for inhibiting localised microorganism growth - using heavy metal coating on paddle swinging in desired locality, preventing fouling of analytical instruments etc.

ROBERTSHAW CONTROLS CO 05.08.76-US-711489
(15.08.78) C12b-01/20

A device is used to inhibit the growth of microorganisms on the surface of an oxygen permeable membrane of an oxygen cell immersed in an aq. culture of the microorganism.

The device comprises a source of antiseptic which has a limited water solubility sufficient to inhibit the microorganism growth in the locality of the membrane but insufficient to inhibit the microorganism growth in the main body of the culture. The source is mounted on a carrier which sweeps the source within the culture across the surface of the membrane in a continuous repetitive manner.

The device is used to prevent fouling of prim. sensing surfaces of analytical instruments e.g. when used in analysing biochemical processes such as an activated sludge treatment of raw sewage or fermentation processes using yeast cultures. The measurements obtd. from the analysing instruments will be more accurate if there is no microorganism growth on the membrane. 5. 8. 76 as 711489 (5pp295)

Coloured protein markers for gel isoelectric sepn. procedures - when protein analysis is facilitated and simplified

ORIENTAL YEAST KK 30.01.76-JA-008388
B04 J03 R16 (15.08.78) G01n-27/26

Isoelectric point markers for gel isoelectric sepn. comprise $\geqslant$ 2 coloured proteins of known isoelectric point pH values, the difference between the highest and lowest pH values being $\geqslant$ 0.5

Determn. if isoelectric point is simplified; many samples can be measured in a short time; and the possibility of proteins being denatured in the pH determn. is reduced.

In an example, a combination of cytochrome c, cytochrome c', cytochrome c_2 and myoglobins was used in the sepn. of isoenzymes of pyruvate kinase extracted from ra liver. 28. 12. 76 as 754976 (6pp1248)

Antibodies specific for 5-substd. barbituric acid derivs. - useful in assay of barbiturate(s) in biological fluids

HOFFMANN-LA ROCHE INC 23.03.76-US-670210 (24.08.71-US-174517)
B04 (15.08.78) A61k-37/06 C07g-07

Barbituric acid specific antibodies (AB) consist of a γ-globulin fraction protein having numerous sites which comple selectively with (a) 5- substd.-1,3-unsubstd. barbituric acids (I), and (b) antigens (A) consisting of (I) coupled at the 5-substituent via a peptide link to a protein or polypeptide immunogenic carrier.

(AB) are made by inoculating a host animal with (A), collecting serum, then pptn. Esp. the γ-globulin protein has mol. wt. about 160000.

Used for assay of (I), e.g. barbital, phenobarbital or pentobarbital, in biological fluids at the nanogram level. (AB) are very specific and will not react with 1,3-substd. barbituric acid cpds. 23. 3. 76 as 670210 Div. ex. 3766162 (+ 12. 7. 73 - US - 378744)(5pp1251)

Aerobic thermophilic decomposition of organic wastes - to produce fertiliser, mulch or animal feedstuff
PAYGRO INC 23.01.78-US-871721 (11.07.73-US-378331)
(13.02.79) A23b-04/12

Animal and other solid organic waste material is aerobically decomposed solely by the action of the host thermophilic bacteria inherently in the material. Individual charges of undecomposed waste are sequentially introduced at one end of an elongate open-top vessel with perforated bottom. The material is not mixed with any other charge.

All the charges in the vessel are maintained in a quiescent state until the last added charge reaches thermophilic temps. The oldest fully decomposed charge is then removed from the other end of the vessel and all the other charges are advanced along the vessel with agitation and mixing within a single charge but no intermixing between charges. When the oxygen content of any charge falls below a predetermined value air under pressure is added through the perforate bottom. The method is used to decompose animal wastes including bedding. All objectionable bacteria a and any virile seeds are sterilized and rendered innocuous.

Continuous steeping of corn prior to milling - in tank with conical bottom angled to prevent channelling
ARCHER-DANIELS MIDL CO 20.07.77-US-817488
(15.08.78) C13l-01

Corn is steeped in a cylindrical tank which has a conical bottom. The corn is steeped in water for 36-48 hours at 110-135°F then fresh corn is passed continuously into the top of the tank and steeped corn and steep water are removed from the bottom. The steeped corn is recovered and the steeped water is recycled together with fresh water in countercurrent flow to the descending corn. The combined water is introduced into the tank at inlets near the junction of the vertical walled portion of the tank with the conical bottom.

Water contg. corn solubles is continuously removed from the top of the tank. The conical bottom has an angle of 22-28° from the vertical side of the tank. The height of the tank is 1.5-2.5 times its dia. above the conical bottom.

Used in the processing of corn by milling. The cleaned corn is prepd. for milling by steeping in an aq. soln. contg a small amt. of SO_2 and lactic acid.

Channeling is prevented and so continuous steeping is possible. 20.7.77 as 817488 (5pp295)

Continuous hot gluing press for leather and footwear blanks etc. - has low-pressure zones to smooth out the blanks before bonding them in high pressure zones
DOKOUPIL J 27.12.77-DT-758349 (17.05.77-CH-006167)
F06 P71 Q36 (19.01.79) B30b-05/04 B65h-05 B65h-29/24 C14b-01/34 C14b-17 D06c-15/04

The process is of the type in which, partic. a pair of superimposed blanks are hot-glued together as they are conveyed through a pressure zone. The path followed by the conveyor carries blanks successively through a low pressure zone, which spreads and smooths out the blanks, and then through a high pressure zone to undergo the pressing operation. The conveyor path rises progressively from the blank loading station. Processed blanks are discharged at a point above the feed station and travelling in the opposite direction to blanks being loaded below.

The conveyor path is pref. provided by lapping a conveyor band around a major arc of a rotary drum and carrying blanks sandwich fashion between band and drum. The low pressure zone is provided by band pressure on the drum due to band tension alone. The high pressure zone is pref. achieved by using a loaded roller on the side of the band remote from the drum.

Used for hot bonding together blanks in laminated pairs for the leather, footwear and clothing industries. The machine has a very high output and is simple to use, a single operator being able to watch and reach both feed and discharge stations. The prod. is free from wrinkles, being smoothed at low pressure before the main pressing operation. 17.5.78 as 014585 (31pp448)

Repairing cracked or broken dental prosthesis - using e.g. cyanoacrylate adhesive and polyacrylic resin
BONYF S A 11.10.78-BE-871179
A96 G03 P32 (A14 A35) (01.02.79) A61c C09j

A cracked or broken dental prothesis is repaired by bonding the broken surfaces to each other with a fast curing, non-toxic adhesive which is compatible with the prothesis material and then forming on the lingual surface, facing the bonded broken surfaces, a joint-cover made of polyacrylic resin and overlapping the lingual surface on either side of the joint.

The lingual surface is pref. first roughened before applying the joint-cover. The joint-cover is prepd. by mixing equal wts. of a polyvinyl acetate powder with a methacrylic acid monomer to form a paste which is then applied and allowed to harden. Pref. before hardening, the cover-joint is coated with the monomer.

Process can be carried out by an unskilled person and does not require a special mould. 11. 10. 78 as 871179 (10pp950)

Disinfecting skin ointment based on alcohol - together with vinyl polymer esp. carboxy contg. vinyl polymer
LANDSTINGENS INKOPS 31.03.78-SW-003646
A96 (D22) (01.02.79) A61k

The ointment contains an alcohol and a modified vinyl polymer. It is prepd. by mixing the ingredients contg. the acid of a modified vinyl polymer, pref. a carboxy vinyl polymer and adding finally a base to obtain the polymer salt.

The ointment is esp. applied to the hands. The use of the polymer enables a high alcohol disinfectant concn. giving a gel consistency with easy application. 13. 10. 78 as 871267 (7pp597)

BADI D21 61708X/33 =DS 2503-582
N-Alkyl-glycine nitriles prepn - by reacting amines with formaldehyde and hydrogen cyanide in presence of water (BE280776)
BASF AG 29.01.75-DT-503582
*B05 C03 E16 (15.02.79) *DT2503-582 C07c-121/43*

N-alkylglycylnitriles of formula $R_1R_2N-CH_2-CN$ (I) are prepd. by reacting amines of formula R_1R_2N-H (II) with formaldehyde and hydrocyanic acid in the presence of water for 0.1-4 hours at 0-40°C, keeping the concn. of hydrocyanic acid at $\not>$0.1 wt.% during reaction. In the formulae, R_1 and R_2 are each (1-10C)alkyl, opt. substd. with (1-4C) alkoxy; R_2 may also be H.

(I) are starting materials inthe prepn. of dyes, fungicides bactericides, textile aids, aids for dental cosmetics, gas purification and process to render materials hydrophobic. The process is simpler and more economical than known processes, giving a better yield and purity. It is more suitable for large scale mfr. as it does not pose problems with waste-water and environmental pollution. 29.1.75 as 503582 (4pp279)

MINN ★ D21 14474B/08 ★DT 2833-711
Sun protection compsns. - based on a UV-absorbing acrylate polymer in a cosmetic oil base
MINNESOTA MINING CO 29.07.77-US-820122
A96 (A14) (15.02.79) A61k-07/42

Sun protection agents are comprised of (a) a non-volatile cosmetically acceptable oil base and (b) $\geqslant$0.5 wt.% (on (a)) of a water-insoluble UV-absorbing (meth)acrylate polymer with a solubility parameter of 6-10 in solvents with weak hydrogen bonding. The polymer is made by polymerisation of the same or different ester monomers of formula $R^3-CH=C(R^2)-COOR^1$ in which R^1 is 1-18C alkyl, R^2 is H, CH_3 or $-CH_2COOH$, and R^3 is H, COOH or $COOR^1$, provided that if R^5 is COOH or $COOR^1$, R^2 is H, opt. with up to 50 mol.% acid monomers of formula $R^4-CH=C(R^5)-COOH$, where R^4 is H or COOH and R^5 is H, CH_3 or CH_2COOH, provided that if R^4 is COOH, R^5 is H.

The agents give good protection against sunburn and are non-irritating to the skin. They are not affected by water sweat, etc., and are suitable for use by sportsmen, etc. 28.7.78. as 833711 (48pp513)

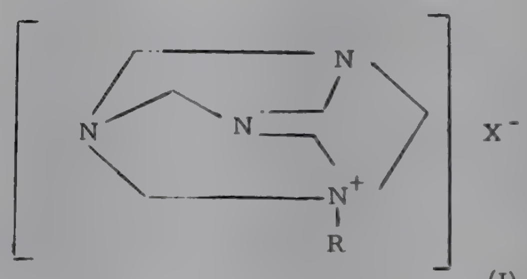
Treating hair with quat. hexa:methylene-tetramine salts - to improve hair structure after waving, bleaching etc.
HENKEL KG AUF AKTIEN 20.12.76-DT-657689
*E13 (21.02.79) *BE-861-989 A61k-07/06 C07d-487/22*

A hair structure-improving compsn. comprises an acid-aq.-alcoholic soln. of $\geqslant$1 quat. salt of hexamethylenetetraamine of formula (I). In (I), R is propenyl, 2-3C hydroxyalkyl, $-CH_2COOR_1$ or $-CH_2CONHR_1OH$. R_1 is 1-4C alk(en)yl. X^- is Br^- or Cl^-. R is pref. $-CH_2CH_2OH$.



(I)

Pref. the compsn. has a pH of 2.5-6.5 (2.5-4). Pref. (I) is present at 1-10(2-7) wt.%, w.r.t. total soln. Pref. the compsn. is an aq. ethanolic or aq. isopropanolic soln..

Compsn. is used to improve hair damaged by waving, blonding or dyeing. 15.12.77 as 052160 (5pp992).

CHAM/ ★ D21 14569B/08 ★GB 2002-232
Removing adipose tissues from certain parts of human body - by applying a vasodilator approximately one hour after taking a high protein low carbohydrate diet
CHAMPION J 24.08.78-GB-034471 (22.06.77-GB-026015)
B05 (21.02.79) A61k-31

Process comprises applying a vasodilator or its mixt. to the area where it is desired to lose fat at a time when the condition of the blood is such that it is taking up fatty components stored in the adipose tissues.

The process removes fats from certain parts of the body, and is an adjunct to known processes of slimming so that certain parts are preferentially affected by the slimming treatment. Thus it is useful for slimming for aesthetic or cosmetic purposes by means of a high-protein, low carbohydrate diet.

Suitable vasodilatory include methyl salicylate, diethylamine salicylate, and nicotinic acid. 24.8.78 as 034471 (4pp957).

CHAM/ ★ D21 14570B/08 ★GB 2002-233
Selector lotion for local removal of fat during slimming - comprises a vasodilator e.g. ethylene glycol mono:salicylate
CHAMPION J 11.09.78-GB-042249 (02.08.77-GB-032303)
B05 E14 (B03 E13) (21.02.79) A61k-31

"Selector lotion" for applying the parts of body to favour local removal of fat during slimming by diet, comprises a suitable blend of vasodilators.

The lotion, cream, ointment or an impregnated dressing can be used on an area selected for localised slimming, and is an adjunct to known processes of slimming for aesthetic or cosmetic purposes.

Suitable vasodilator is ethylene glycol monosalicylate, contg. a small amt. of ethyl alcohol and is pref. applied approx. 1 hr. after taking a high-protein, low-carbohydrate diet. 11.9.78 as 042249 (4pp957).

NIBU- ★ D21 14723B/08 ★J5 4005-048
Gelatin hydrolysate prepn. for cosmetics - by heat treating aq. gelatin soln., enzymatically hydrolysing and opt. treating with active carbon
NIPPON BULK YAKUHIN 12.06.77-JA-069139
(16.01.79) A61k-07 C07c-99/02

The method comprises treating aq. 20-40% gelatin soln. at 100-120°C for 1-3 hrs., hydrdysing enzymatically and opt. treating with active carbon.

The hydrolysis of gelatin is effected at 40-70°C for 10-120 mins. using protease ca. 1% on gelatin. After the hydrolysis the soln. is made to pH ca. 10 with aq. NaOH soln. and boiled for 10 mins. to deactivate protease.

The pretreatment reduces the time required for the enxymic hydrolysis and obtd. hydrolysate is virtually odourless. The remaining odour can be easily deodorised by treating with active carbon. The hydrolysate has constant molecular wt. 12. 6. 77 as 069139 (2pp5)

SHIS ★ D21 14724B/08 ★J5 4005-049
Gel compsn. for nail enamels - comprises chip compsn. of montmorillonite clay, nitrocellulose and swelling and plasticising substance, dispersed in organic mixed solvent
SHISEIDO KK 09.06.77-JA-068324
A96 (A11) (16.01.79) A61k-07/04

Gel compsn. is prepd. by dispersing 10-30% of a chip compsn. in 90-70% of an organic mixed solvent. The chip compsn. is obtd. by mixing (a) 25-70 wt.% of organic modified montmorillonite clay, (b) 5-70 wt.% of nitrocellulose and (c) 5-30 wt.% of a swelling agent for (a) and plasticiser for (b), and kneading the mixt. while heating and compressing it.

Substance (c) is (1) cpds. of formula $HO(RO)_mH$ (R is C_2H^4 or C_3H^6, m = 3-90), (2) cpds. of formula $R'O(RO)_nH$ (R is the same as above. R' is $C^4H_9-C_2OH^{41}$, n = 1-50) and (3) esters prepd. from 4-20C dibasic acid and 1-4C lower alcohol.

The chip compsn. shows no loss of gloss or transparency in nail enamels and excellent nail enamels can be obtd. with it. 9.6.77 as 068324 (7pp5)

Dental prosthesis working model prodn. - using device with jaws and ribs to hold model
JET-CERAMIC DENTAL 01.08.77-GB-032133
P32 (22.02.79) A61c-09

D/S: FRE, (CH, DT, GB, LU, SW) N, SU, US.

Device for producing a dental working model for making dental prostheses has an integral base (1) in which is formed an arcuate hollow space (6) open at both its ends and corresp. in its configuration to the contour of the jaws. The raised sides of the space have their respective faces (7,8) provided with transversely extending ribs for the formation of retention marks in the plaster model.

The device provides accurate and secure guidance of a plaster model in its dismembered (sawn apart) state. Local deformation is made possible.

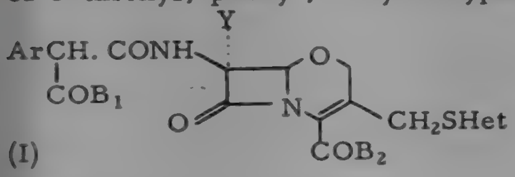
7-Aryl:malonamido-1-oxa-de:thia-cephalosporin derivs. - useful as broad spectrum antibacterials resistant to beta-lactamase
SHIONOGI KK 12.10.78-BE-871213
B02 C02 E13 (01.02.79) A61k C07d

1-Oxadethiacephems of formula (I) are new. In (I) Ar is 2- or 3-thienyl, phenyl, 4-hydroxyphenyl or 4-acyloxyphenyl



(I)

where acyl is derived from an organic or inorganic acid. COB_1 and COB_2 are opt. protected carboxy. Het is 1-Q-1H-1,2,3,4-tetrazol-5-yl or 2-methyl-1,3,4-thiadiazol-5-yl. Q is CH_3 or COB_3. COB_3 is opt. protected carboxy. Y is H or CH_3O but if it is CH_3O then Het must be 1-methyl-1H-1,2,3,4-tetrazol-5-yl.

(I) are antibacterials useful in human or veterinary medicine and as disinfectants. Compared with known oxadethiacephalosporins they are more active aginst Gram negative species and resistant strains (such as Enterobacteria, Serratia, Proteus), give high concns. in the blood, and are more stable to β-lactamase. Cpds. with Y=CH_3O have a broader spectrum of activity (Pseudomonas and anaerobes such as Bacteroid fragilis), greater activity aga against β-lactamase producers, higher stability in the blod blood and reduced tendency to combine with serum proteins. A typical cpd. is 7β-[α-(2-thienyl)-α-carboxyacetamodi]-3-(1-methyltetrazol-5-yl)thiomethyl-1-oxadethia-3-cephem-4-carboxylic. 12.10.78 as 871213 Add to 852912 (105pp)

Sterilising oily and aq. fluids with azide biocides - esp. using ethoxylated alkyl azide with surfactant character
MOSER J 13.08.77-DT-736646
E16 H07 P34 (D15 E37) (15.02.79) A61l-13

(In)organic azides (I) are used as biocides for the long-term sterilisation of waters, esp. oil-contg. waters, including oily liqs., e.g. (a) petroleum and crude oils, and (b) oil-in-water and water-in-oil emulsions, e.g. cold lubricants and non-inflammable hydraulic fluids.

Azides with surfactant character, pref. 3x ethoxylated undecyl-azide, are used partic. to facilitate the handling of oil concentrates and for preparing sterile oil-in-water emulsions.

Bactericidal and fungicidal activity of (I) sets in immediately. The microorganisms in oils, oil-in-water emulsions and aq. fluids are destroyed, even during movement of fluids. Clogging of filter devices, screens and narrow conduit passages is prevented. Plastic and metal conduits are not corroded by (I) at alkaline pH. Flow properties of liqs. treated is unchanged. (I) are detoxicated with $FeCl_3$, to form non-toxic complex cpds. 13.8.77. as 736646 (11pp200)

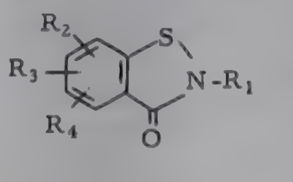
Preserving solns. of hydrophilic colloid contg. viscosity improver - for forming photographic materials, by addn. of benzisothiazol-3-one(s)
FUJI PHOTO FILM KK 03.08.77-JA-093232
A89 E13 G06 R23 (21.02.79) G03c-01/37

The degradation of solns. contg. ≥1 hydrophilic colloids (I) and which also contain a viscosity-increasing anionic polymer (II) contg. an acid gp. consists of the addn. of ≥1 benzisothiazolones of formula (III) to the soln. The (I) is used as a binder for Ag halide photographic light-sensitive materials.



(III)

In the formula, R_1 is H, or opt. substd. 1-20C alkyl; and R_{2-4} are each H, halo, 1-6C alkyl, or opt. substd. 1-6C alkoxy. Addn. of small amts. of non-toxic (III) (at pref. 0.01-0.25 wt.%) reduces the known microbial decompsn. of (I) (e.g. gelatin) over a wide pH range without impairing the viscosity reducing activity of (II). (III) do not cause a redn. in sensitivity esp. during high temp./high humidity storage, do not change gamma, do not cause fogging, and do not affect the stability of formed latent images, etc. (III) are at least 10 times more active than phenols, and are effective against bacteria, yeasts and moulds. 28.7.78 as 031535 (13pp478).

Treating wood to prevent size change, warping, etc. - by impregnation with a soln. of alkylamine
SHIN ASAHIGAWA KK 10.06.77-JA-068431
C03 E16 F09 P63 (16.01.79) B27k-03/34

The wood which has not been used as a high class decorative material and material for furniture, toys, etc. due to change in size, cracks, flowing out of resin, etc., can be made free of those defects. The adhesive property, paintability and surface hardness of the wood can be improved remarkably, and soft wood can be treated and used for floors, tables, etc. The alkylamine soln., after the treatment, is decanted and the clear soln. can be recycled. The treatment can be practiced without pollution, and the sedimented sludge can be used as a feed for earthworms.

Pref. the alkylamine is triethylamine, diethylbutylamine, diethylaminoethanol, etc. used as an aq. soln. of 0.1-0.5% concn. Firstly, the wood is pretreated by immersing it in the soln., heating it slowly to 92-98 °C and then boiling it. Then it is press-heated in the soln. in a pressure pan and the pressure is reduced to decrease the moisture content to the fibre satn. point. Finally it is dried naturally and/or artificially. Pref. an antiseptic and/or insecticide is added to the alkylamino soln. 10.6.77 as 068431 (7pp5)

A soln., suitable for disinfecting the circulatory fluid in a closed-circuit toilet system consists of (by wt.) 5-20% formaldehyde, 0-1.5% glyoxal, 2-13% glutoraldehyde, 0.5-5% quat. ammonium biocide (I), 0-5% inert scent, 0-5% non-ionic ethylene oxide adducts of higher fatty alcohols or alkyl phenols having 8-22C, 0-5% inert dye, and balance solvent (II).

(I) is benzyl trimethyl ammonium chloride, benzyl dimethyl dodecyl ammonium chloride, dichlorobenzyl dimethyl dodecyl ammonium chloride, dodecyl trimethyl ammonium chloride, dodecyl pyridinium chloride or (p-dodecylbenzyl)trimethyl ammonium chloride; (II) is water opt. mixed with 2-4C glycol or 1-4C aliphatic alcohol.

The disinfectant is esp. used in the toilet systems which operate with aq. flushing liqs. 14.6.76 as 695456 (5pp976)

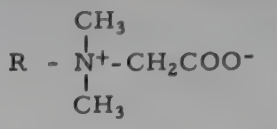
MICH/ ★ D22 15659B/08 ★US 4107-328

Antimicrobial compsn. of acid pH contg. betaine, amine oxide - used for controlling bacteria, fungi, protozoa and preventing body odour

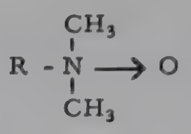
MICHAELS E B 26.05.77-US-800898 (02.04.75-US-564454)

B05 C03 (15.08.78) A01n-09/20

Broad spectrum antimicrobial composition of low toxicity consists of 0.1-40 parts by wt. of betaine (I), 0.1-40 parts wt. of amine oxides (II), (III) or (IV) and a protonating agent to adjust the pH to 4.0 -5.5. In the formulae R is (10-18C) alkyl or mixed (10-18C) alkyl.

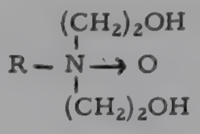


$R-\overset{CH_3}{\underset{CH_3}{N^+}}-CH_2COO^-$ (I)



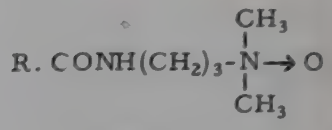
$R-\overset{CH_3}{\underset{CH_3}{N}}\rightarrow O$

(II)



$R-\overset{(CH_2)_2OH}{\underset{(CH_2)_2OH}{N}}\rightarrow O$

(III)



$R.CONH(CH_2)_3-\overset{CH_3}{\underset{CH_3}{N}}\rightarrow O$

(IV)

Compsn. is non-toxic and causes less eye irritation than soap. It may also be used for treatment of dandruff, crotch itch, athlete's foot and acne. A typical compsn. contains coco-N-betaine (6%), cocoamido-N, N-dimethylamine oxide (6%) and citric acid (0.55%) in distilled water. 26.5.77 as 800898 (+ 18.12.75 - US - 641727)(7pp916)

Continuous mfr. of composite non woven matting - for disposable cloths with good drape and hand properties

PROCTER & GAMBLE CO 06.06.75-US-584312

*A94 F04 +P73 (A23 A96) (15.08.78) *BE-842-632 +B32b-03*

Nonwoven cloth of increased toughness and tear resistance comprises at least two types of organic polymer fibres, one being elastomeric and one elongatable but non-elastic. At least one fibre type is dispersed to give frequent random fibre intersections which are bonded so that the non-elastic fibres can be stretched between bonds with few breakages.

The bonds include at least some heat bonds between both fibres of the same type and fibres of different types. The elastomeric fibre is pref. polyurethane and the non-elastic fibre is polyester or polypropylene. In particular, the cloth is suitable for lingerie and has the softness, drape, hand, feel elasticity and appearance of a knit rayon jersey. 6.6.75 as 584312 (28pp1358)

Water repellent cellulose surfaces - prepd. by vapour phase treatment of cellulose with acid chloride(s)

GORDON R G 06.07.76-US-702534

A96 P32 P73 (A11) (15.08.78) A61f-13/16 B32b-27/42

Cellulose sheets, pads, or cloth with $\geqslant 1$ H_2O-repellent side are new. The H_2O-repellent side(s) consist of the vapour phase reaction prod. of the cellulose (I) with an acid chloride of formula RCOCl (II) (where R is 6-20C straight-chain, branched-chain, or cyclic aliphatic hydrocarbon).

Exposure of (I) to vapours of (II) for short (1-15 sec.) reaction times affords permanent highly H_2O-repellent treated surfaces, while unexposed areas remain H_2O-permeable. The treated prods. are esp. useful as disposable articles of sanitary clothing, sanitary napkins, bandages, paper cups, and bags, etc. In addn., compared with known processes (US 3934587 etc.), the above inexpensive method does not need to be effected in the presence of long-chain aldehydes, or solvents. Also treated surfaces do not wrinkle (like liq. phase treatments). Finally, treated prods. are fully biodegradable, and may be prepd. without using petrochemicals (including PVA) on a fully automated basis.

In an example, very thin sheets of tissue paper were exposed to $Me(CH_2)_nCOCl$ (n=6-16) for 1-60 sec. at temps. to give acid chloride vapour pressure 10-20 mm. Very hydrophobic surfaces were formed. 6.7.76 as 702534 (12pp478)

(I) are broad-spectrum antibacterials for use as therapeutic agents and antiseptics for use in cleansing and disinfecting compsns. 28.6.76 as 700697 C.i.p. 3983113 4049806 (+14.10.75, 15.8.75-US-621717, 605109) (22pp1248)

SAND/ ★ D22 15962B/08 ★WP 7900-077
Sterilised storage container with temp. and pressure responsive valve - for automatic sealing during sterilisation cycle and before removal from autoclave
SANDERSON R S 10.04.78-US-895239 (01.08.77-US-821042)
P31 P34 Q33 (22.02.79) A61b-19/02 A61l-01 A61l-03 B65d-51/16

D/S: (CH, DT, FR, GB, LU, SW) E, BR, SU.

Appts. for containing articles during sterilization or storage comprises a container provided with a pressure responsive device for sensing a redn. in the pressure of a sterilizing environment applied to the exterior of the container. A valve permits flow of a steam environment into an expandable chamber until a predetermined temp. is reached, at which time a temp. responsive valve closes. This results in the capture of a vol. of steam within the chamber which is utilized to provide a force, upon a redn. in pressure surrounding the chamber, which is used to seal closed a valve opening in the container.

Steam sterilization of objects, e.g. surgical instruments and other medical items, in gravity and vacuum autoclaves.

The container automatically seals itself during the sterilization cycle and before removal from the sterilizer, so that the container contents are maintained in an aseptic environment without danger of recontamination during storage.

26.7.78 as US0050 (56pp1044).

Wool wax lanolin prepn. from wool degreasing extract - using hot methanol and alkali then sepg. wax layer
UNISEARCH LTD 10.10.77-AU-001987
B01 (01.02.79) C11b C11c

The extract, obtd. by treating a liquor arising from wool degreasing, is heated to above its m.pt. The molten extract is then mixed with hot methanol, and alkali added in amt. about 120% of that required for neutralising the extract, The insoluble immiscible wax layer is sepd. and the wax recovered by drying the sepd. layer.

The extract used is obtd. from an aq. mixt. the soaps being converted into fatty acids, by codistilling the mixt. with a water immiscible fat solvent. Most of the water, the insoluble solids or the material coagulated from the fat soln. are sepd. by known methods. The condensed solvent/water to sepd. and the solvent is recycled. The fats are recovered from the solvent soln. by known methods.

The process enables simple sepn. of the wax and avoids environmental pollution. The product may be used as a lanolin. 10.10.78 as 871137 (13pp597)

*A60 B05 E14 (15.02.79) *DT2250-065 C07c-37/22 C07c-39/08*

2, 3, 5-Trimethylhydroquinone (I) is purified by dissolving crude (I) in an ester of formula RCOOR' (in which R is H or (1-3C) alkyl; and R' is (1-4C) alkyl) or in acetone, ethylmethylketone, diethylketone, methylisobutylketone or cyclohexanone. Crystalline (I) is obtained after adding pentane, hexane, octane, cyclohexane, cyclohexene, benzene, toluene and/or xylene.

(I) is an anti-oxidant for fats and oils; a UV-absorbant for plastics, gums and rubbers; and an intermediate for medicaments, esp. vitamin E. The process gives (I) in pure white crystalline form which is colour-stable in yields of >90%. Evaporation of the solvents used in simpler and requires less heat. In an example crude (I) is dissolved in ethylacetate at 55°C, filtered and cooled. Hexane is added to give 93.7% of (I) with a purity of >99%. 12.10.72 as 250065 (4pp279)

STAG/ D23 30854W/19 =DS 2352-859
Crude fatty acids treatment - in stripping column and enrichment columns with condensed column vapour reflux
STAGE H 22.10.73-DT-352859
*(15.02.79) *DT2352-859 C11c-01/08*

The process de-gases de-waters and de-odorises crude fatty acid, superheated booster steam being directed in the opposite direction to the acid to be treated.

The steam is passed through a discharge scrubber column for the acid and then through or past the column distribution base into an amplification column acting on the distributor base subjected to the crude acid. The vapours arriving in the tower head are condensed, and the fatty acid then separated from the condensate forms part of the return flow into the amplification column. 22.10.73 as 352859 (4pp160)

UNIL ★ D25 14186B/08 ★BE-869-806
Aq. liq. detergent compsn. prepn. for washing clothes etc. - using alkanolamine to avoid sediment formation
UNILEVER NV 22.08.77-GB-035089
E34 (19.02.79) C11d

Prepn. of the detergent compsn. comprises adding 0. 5-5% of a mono-, di- or tri-alkanolamine, pref. triethanolamine to a compsn. contg. an active additive which contains 2-10 % detergent, $\geqslant$2% sodium tripolyphosphate, $\geqslant$2% alkali metal orthophosphate, the sum of the two phosphates being 5-35% and a hydrotrope or stabilising system, in which the alkali metal orthophosphate is formed in situ by neutralising with the appropriate base.

The in situ neutralisation results in the formation of a little undesirable sediment and the addn. of the alkanolamine overcomes this. A further advantage is that the modified process enables a higher sodium tripolyphosphate content ($>$12%) without having to use a polyphosphate which hydrates rapidly or has a high phase I content. 17. 8. 78 as 869806 (6pp597)

Conc. dilutable aq. surfactant compsn. - contains mixt. of amphoteric and/or Zwitterionic surfactants and anionic surfactants

ALBRIGHT & WILSON LTD 26.07.77-GB-031350

(15.02.79) C11d-01/94

Compsn. consists of water and a mixt. (A) of active ingredients, and can be diluted to 5-30 wt.% active ingredient concn. The mixt. (A) consists of $\geqslant 10$ (>40) wt.% of $\geqslant 1$ amphoteric or zwitterionic surfactant and $\geqslant 10$ wt.% of $\geqslant 1$ anionic surfactant, opt. together with $\geqslant 1$ nonionic surfactant. The compsn. is predominantly present in G-phas.

The compsns. can be used for industrial and domestic purposes. Pumpable surfactant mixts. can be prepd. at active ingredient concns. exceeding twice the max. achievable so far, whereby transport and storage costs are saved. The compsns. have bacteriostatic activity. They are easily diluted, without gelling, or adding water. 26.7.78. as 832814 (24pp200)

GLOB- ★ D25 14476B/08 ★DT 2833-770

Cistern mounted lavatory cleaning agent - with composite cleaner which disintegrates gradually in water, contained in perforated container

GLOBOL-WERK GMBH 03.08.77-CH-009611

A97 Q42 (15.02.79) E03d-09/03

Cleaning agent inserts for lavatory cisterns comprise a container fixed to the wall of the tank, contg. a solid cleaning compsn. which disintegrates gradually in contact with water. The container has a solid base and carries holes in the side wall which are below the level of water in the cistern. As the solid cleaning agent gradually disintegrates, an aq. layer contg. the disintegration prods. forms in the lower part of the container below the level of the holes in the side wall. The cleaning agent insert projects above the level of the holes in the side wall.

The design of the cleaning agent container ensures that a charge of cleaning agent is released into the water in the cistern each time it is flushed, independent of how frequently flushing occurs or how quickly or slowly the cistern refills. The solid cleaning agent may contain e.g. non-ionic, anionic and cationic surfactants, Na sulphate, Na tripolyphosphate, Na pentachlorophenol, blue dye and perfume agent. 2.8.78. as 833770 (14pp513)

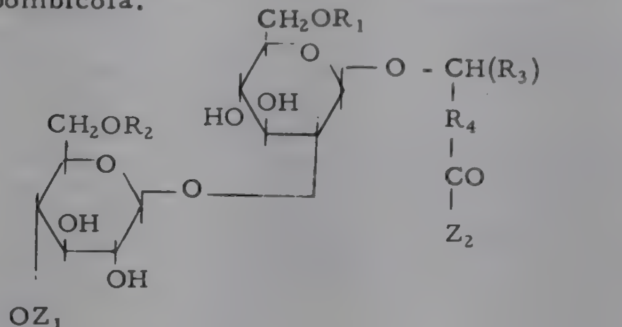
KAOS ★ D25 14599B/08 ★GB 2002-369

Dehydration purification of hydrated sophorolipid - by addn. of poly:hydric alcohol(s), to reduce viscosity of low water content materials

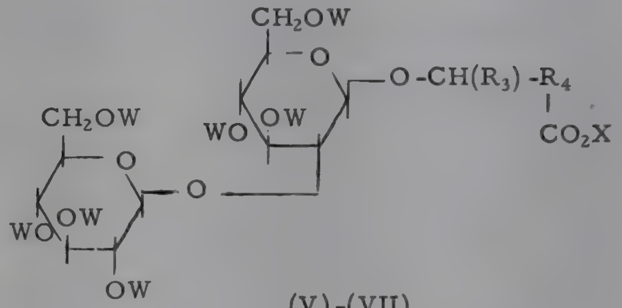
KAO SOAP KK 01.08.77-JA-092428

E13 (D16) (21.02.79) C07d-309/10 C07d-323/04

The dehydration purification of hydrated Sophorolipid (complex mixts. of cpds. (I) and (II)) or the sec. derivs. (V)-(VII) consists of the addn. of $\geqslant 1$ polyhydric alcohols $HO{+}C(R_8)HCH_2O{+}_m R_9$ (III) and/or $HO{+}CH_2CH(OH)CH_2\text{-}O{+}_n H$ (IV), then removal of H_2O by distn. in vacuo. Hydrated Soporolipid is obtd. by the culture of Torulopsis bombicola.



(I) and (II)



(V)-(VII)

In the formulae, R_1, R_2=H or MeCO; R_3= H or Me; R_4=opt. unsatd. hydrocarbon with 12-16C when R_3 is H, and 11-15C when R_3 is Me; for (I) Z_1Z_2 are together as bond, for (II) Z_1=H, Z_2=OH; for (V) X-R_5, W=H, or for (VI) X=R_6, W=H, or for (VII) X=R_7, W=R_7; R_5=H or Me; R_6= 2-20C alkyl; R_7=2-5C hydroxyalkyl; R_8=H or Me; R_9=H or 1-5Calkyl; mn=1-6).

Addn. of (III) and/or (IV) considerably reduces the viscosity of Sophorolipid (and derivs.) and allows contained H_2O (after isolation with EtOAc, etc.) to be removed completely an essential for deriv. formation (e.g. alcoholysis with acid catalyst to afford a hydroxy fatty acid polyhydric alcohol ester, suitable as an inter. for a large ring lactone musk useful as a perfume). Sophorolipid is a known complex mixt. of closely related cpds. ((I) and (II)) which is useful as a wetting agent, cleanser, and emulsifier possessing excellent hygroscopic and hydrophilic props., and which is compatible withskin physiology. Secondary derivs. (V)-(VII) possess good stability, and activity similar to the parent cpds.. 28.7.78 as 031468 (7pp478).

PROCTER & GAMBLE CO 22.03.77-US-779961

E34 (E33) (13.02.79) C11d-03/07 C11d-07/16

Detergent compsn. with a free alkalinity of 6-8 wt. % NaOH comprises (a) 1-70 (10-30) wt. % anionic and/or nonionic surfactants, (b) 5-50 (15-33) wt. % Na/K ortho- and pyrophosphates, the wt. ratio of ortho:pyro being 9-3:2-7 and (c) 0. 1-10 (1-5) wt. % of a water-sol. Mg silicate having a molar SiO_2:MgO ratio of 3. 2-1:1-4.

The compsn. forms little or no deposit on the surfaces of the drums (and esp. of the heating elements) in washing machines and less deposits of insoluble inorganic matter on fabrics washed with hard water. 22. 3. 77 as 779961

(5pp922)

LIOY D25 50647Y/29 =US 4139-498
Conc. olefin-sulphonate soln. prodn. - for use in mfr. of washing and cleaning compsns.
LION FAT & OIL KK 26.12.75-JA-154809
*A97 E17 (13.02.79) *DT2657-620 +C11d-01/14 C11d-03/37 C11d-11/04*

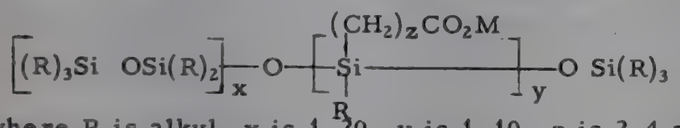
An aq. olefin sulphonate soln. is mfd. by neutralising and hydrolysing the reaction prod. obtd. by sulphonating an a-olefin contg. 10-20C, by performing neutralising and hydrolysing steps in the presence of an alkaline material in amt. equal to sum of amt. A plus amt. B, where A is stoichiometric amt. of alkaline material to effect neutralisation and hydrolysis of reaction prod. and B is 0.2-1.5 times amt. of A.

PVA with degree of polymerisation of 500-2000 where its amt. is 0.2-2.0 times amt. of B. Water is in amt. effective to make water content of prod. of neutralising and hydrolysis steps $<$50%. Pref. alkaline material is NaOH, KOH, Na_2CO_3 or mixts., to 15-35 wt.% soln.

a-olefin sulphonates are prepd. at high concn. having a low viscosity for use in granular heavy duty detergents. Prepn. does not interfere with prepn. of detergent slurry. 16.12.76 as 751164 (4pp931)

WITC ★ D25 15873B/08 ★US 4139-546
Anionic silicone defoamer for use in laundry detergent compsn. - prepd. by reacting di- and tri-alkyl:halo:silane and beta-cyanoalkyl:alkyl:di:halo:silane in presence of alkali hydroxide
WITCO CHEMICAL 06.09.77-US-830552
A26 E11 (A97) (13.02.79) C07f-07/08

Prepn. of an anionic silicane defoamer of formula (I)



$$\left[(R)_3Si\ \ OSi(R)_2\right]_x-O-\left[\underset{R}{\overset{(CH_2)_zCO_2M}{Si}}-\right]_y-O\ Si(R)_3 \qquad (I)$$

(where R is alkyl, x is 1-20, y is 1-10, z is 2-4 and M is a monovalent cation) comprises reacting a dialkyldihalosilane, trialkyl halosilane and β-cyanoethyl- or β-cyanopropyl alkyldihalosilane in the presence of MOH, the alky of the silane being methyl or ethyl. Laundry detergent compsn. consists of a sulphonate or phosphate detergent and $\leqslant$ 1 wt.% of (I).

Laundry detergent exhibits reduced foaming even after several months storage. (I) retains its stability in the presence of large amts. of nonionic and/or anionic surfactants. (I) also reduce foaming tendency in herbicides, cleansers, adhesives, cutting oils, lubricants, textile dyes, latex paints and fuel oils. 6.9.77 as 830552 (3pp966)

SHEL ★ D25 15880B/08 ★US 4139-56
Acid catalysed alkylene glycol alkylation with olefin - using liq sulphur di:oxide as solvent, giving mono:ether cpds. useful a detergents
SHELL OIL CO 03.10.77-US-838506
E17 (13.02.79) C07c-41/06

Reaction of olefins with (poly)alkylene glycols (I) at 25-250°C in presence of acid catalyst to give (poly)alkylene glycol monoalkyl ethers (II) is improved when liq. SO_2 is present. Reaction is esp. at 1-200 atmos. with mole rati olefin:(I):catalyst (H equiv):SO_2 of 1:1-30:0.01-10:1-100. Catalysts are pref. Bronsted acids with pKa $<$2.5 or Lewis acids with heats of complex formation with pyridin more exothermic than 9 kcal per mole.

(II) are industrial detergents. Use of SO_2 solvent improves conversion and selectivity, esp. it prevents polymerisation to higher glycols. 3.10.77 as 838506 (4pp1251)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

LUCNY M 02.02.78-CS-000671
(30.11.78) A21d-02/14

BABW ★ D11 16166B/09 ★DT 2736-549
Thermal treatment of viscous material e.g. gluten - in injection drier through two-jet nozzles in particle laden hot air
BABCOCK-BSH AG 13.08.77-DT-736549
Q76 (22.02.79) A21d-02/38 F26b-03/12

In the thermal treatment of pasty and viscous material of the consistency of soft rubber, e.g. wheat gluten, the material is injected in a dryer into a flow of hot air, laden with already dried particles of 10-500 µ particle size. Monopumps (RTM) take the material at 1.5-5 bar to a two-jet nozzle, where compressed air at 2.5-7 bar effects the injection into the hot air stream which flows at 20-30 m/s velocity.

The arrangement results in a gently and brief drying action of the wheat gluten. If the air cooling is not sufficient to prevent all deposit formation, water can be readily fed to the nozzles. 13.8.77. as 736549 (13pp39)

WOOD/ ★ D11 16277B/09 ★DT 2835-278
Decorative icing machine - with pump feeding flexible hose and nozzle and with pressure relief valve for return (NL 13.2.79)
DEWITT WOODY G 11.08.77-US-823613
(D13) (22.02.79) A21c-09/04 A23g-03/28 A23p-01

A machine to apply fancy icing and decoration to confectionery and pastry, consists of a pump unit which is connected at its intake to a storage tank for the decoration material. Its delivery is linked to a flexible hose with a squirting nozzle at the end and also through a pressure relief valve to a return pipe into the tank.

The arrangement saves the manual work of squeezing an extrusion bag and of refilling it in intervals. It requires only one hand for operation and leaves the other for manipulating the pastry. 10.8.78. as 835278 (14pp39)

TAKE/ ★ D11 16291B/09 ★DT 2836-241
Bread prodn. in kneading and baking oven - with baking tin lifting table, paddle-mixer and heating units
TAKEUCHI S 19.08.77-JA-099833
(22.02.79) A21c-01/02 A21d-08/06

Bread is produced in an oven in which a baking tin with the flour, baking powder, yeast and other ingredients is mounted on a vertically movable table. Water, preheated in the oven, is also added. The tin can be raised and stirring paddles mix the contents. After lowering for fermentation, the tin is raised again for the dough kneading. The tin is finally lowered to bake the bread loaf.

This produces tasty bread, partic. for households, without any necessity for kneading by hand. It enables unskilled persons to bake bread of uniformly good quality independent of ambient temp. fluctuations. 18.8.78. as 836241 (24pp39)

RADI/ ★ D11 16298B/09 ★FR 2391-689
A soft pad for supporting biscuits during buttering - comprising biscuit crumbs beneath film covering a sheet support
RADIGOIS J M 04.10.76-FR-029993
A97 P28 (26.01.79) A47j-47

A plaque for supporting biscuits while applying butter comprises a rectangular piece of cardboard waxed paper or plastic film covered with a layer of powdered biscuit enclosed by a flexible plastic (cellophane) film. The support adapts to the shape of the base of the biscuit to inhibit cracking or skidding during buttering. The support utilises broken biscuit material and can be printed with e.g. advertisements. 4.10.76 as 029993 (3pp515)

THOM/ ★ D11 16358B/09 ★GB 1538-360
Low calorie diet bread - contg. added gluten, protein, alpha-cellulose flour and edible gum
THOMPSON J B 02.03.77-US-773499 (27.05.76-US-690501)
A97 (17.01.79) A21d-02/26 A21d-10 A21d-13/06

Dough compsns. for breadmaking contain per 100 pts. wheat flour 3-9 pts. added vital wheat gluten, 5-12 pts. edible protein, 10-20 pts. alpha-cellulose flour and 0.5-6 pts. edible gum. The protein is esp. low fat soy flour, or soy flour with non-fat dried milk. The cellulose pref. has particle size 25-50µ. The gum is a synthetic cellulose ether, esp. NaCMC, or guar gum or tragscanth.

The prod. has fewer calories, higher protein content and fibre content than conventional breads or diet breads. 23.5.77 as 021626 (18pp955)

UNIL D11 75689X/41 =GB 1538-428
Prepn of cooked food prods in packages - with second cooking when required for consumption after long storage
UNILEVER LTD 26.03.75-GB-012753
*A92 +Q31 Q34 (17.01.79) *BE-839-929 A21d-15/04*

Packaged baked goods are produced having improved shelf-life, comprises baking goods enclosed in a foil package, providing an aseptic barrier while permitting vapour to escape during baking, cooling and hermetically sealing and heat-pasteurisation.

Pref. baking is at min. interior temp. of 90°C for > 30 mins. to ensure complete sterility of interior of prod., esp. 120-160°C for 1 hr. Temp. is permitted to fall by 20-30°C during baking. A water activity of prod. is realised < 0.95.

Esp. used to package part-baked bread, buns, cake etc. made from dough or pastry prepd. from flour. 24.3.76 (4pp931)

SUGA- ★ D11 16365B/09 ★GB 1541-212
Appts. for forming confectionery cases - with chocolate casing on inner and outer surfaces of edible base
SUGARCUP BISCUIT CO 23.11.74-GB-050828
(D13) (28.02.79) A21c-15

An edible container for a confection comprises a self-supporting base and walls of a solid coherent baked edible material, coated on both sides with a continuous chocolate coating. The container is produced in an appts. which includes a conveyor belt having a first rober positioned over a first run of the belt. This coats the insides of articles on the belt with chocolate.

The articles are inverted by a tripping mechanism downstream of the first rober. A second rober is positioned over a second run of the conveyor and this coats the outer side of the inverted articles. A final stretch of the conveyor is used for drying the coatings. 3.11.75 (-pp295)

MOMI ★ D11 16373B/09 ★GB 1541-457
Appts. for producing roll cake - with toothed wheels rolling sheet of cake material
MORINAGA & CO LTD 28.05.75-JA-063922
(28.02.79) A21c-15

A Swiss roll type of cake is produced by advancing a sheet of the cake material from a lower to an upper level and simultaneously gradually turning the sheet from a horizontal to a vertical position. The vertical sheet is stopped at its upper level and is released so that it falls into a rolling-up device.

This comprises guide toothed wheels carried by a rotatable shaft, and first, second and third toothed wheels carried by respective first, second and third shafts. The shafts are all parallel and rotatable in the same direction.

The toothed wheels cooperate to roll-up the sheet prior to discharge.

The appts. is used to produce a cake of the Swiss roll type. The method replaces a manual process. 15.4.76 as 015692 (7pp295)

UPRO= ★ D11 17548B/09 ★SU -602-149
Bread-making ingredients mixer - has mixer-conveyor unit as hubs of wheel on vertical shaft, with curved plates, on its central section
UKR PROV EQUIP RES 11.06.75-SU-143496
(27.03.78) A21c-01/06

Mixing machine comprises a chamber to process the ingredients, in the lower part of which the mixing/conveying unit is positioned horizontally on a drive shaft, plus recirculation pipes with nozzles. Batch mixing of the dough and aeration are made more intensive by making the mixing/conveying unit as hubs of a wheel placed on a vertical shaft, in the central part of which are fastened curved plates and, in the peripheral part, vanes.

Each of the latter is provided with vertically-positioned end plates; at the level of the upper edges of the curved plates a supporting/guiding disc is mounted, with a rotating head fastened to the bottom of the chamber. The rotating head is fitted with a cone, and a screw is put into the cavity of the head to improve the transportation of the dough through the recirculating pipes.

Braverman, I.M. Bul. 14/15.4.78. 11.6.75. as 143496 (6pp29)

UPRO= ★ D11 17549B/09 ★SU -602-150
Biscuit-dough blanks patterning equipment - has series of intermeshing gears and cams and rollers to actuate rod bearing needles
UKR PROV EQUIP RES 27.02.74-SU-001668
(27.03.78) A21c-11/12

Device is used during the production of biscuit products, comprises a supporting surface holder, hollow shaft with a rod fastened to it and, fitted into the holder, a pricking attachment, consisting of a ring and a rod with a pattern holder on its end, made up of pricking needles. Construction is improved and operational reliability increased by fixing the hollow shaft into the holder so that it can rotate about the vertical axis.

On the lower end of the hollow shaft is a disc with cams and, to the lower end of the rod, a bracket is fastened. This is firmly connected to the rings and has symmetrically-arranged holes to allow rods to pass through. These rods are spring-loaded and the pattern holders with their needles are mounted on the rods so that they move axially and are provided with springs.

Mirmilshtein, I.M. Bul. 14/15.4.78. 27.2.74. as 001668 (4pp29)

SEYM/ ★ D11 17934B/09 ★US 4140-804
Prepn. of cake with internal and external icing - by using carbonated cola drink to give porous cake and effervescent icing
SEYMOUR J J 23.06.77-US-809082 (14.05.76-US-686296)
(20.02.79) A21d-13/08 A23g-03

Prepn. of an edible, cake-like food (I) which has an exceptionally highly porous texture inside, and an edible coating on the outside that extends through holes into the inside, is claimed.

Flour and sugar are mixed, and butter milk, baking soda, eggs, and vanilla are mixed in a separate bowl. A mixt. of carbonated cola drink, cocoa, butter or margarine, and marshmallow in a saucepan is heated to the point of boil (not boiled) when a rapid increased effervescence of the cola occurs. The flour-sugar is added to heated mixt. and blended with it. The butter milk-contg. mixt. is then blended in when an instantaneous vigorous reaction occurs which produces CO_2 and foams the mixt. The mixt. is removed from the heat source and blended for a further 2-3 mins. It is then placed in a greased, floured baking pan and baked for 30-40 mins. at 350°F, holes (nail-like size) are punched in the top of the cake extending to $\sim\frac{1}{2}$ inch. from the botton, and $\sim\frac{1}{2}$ inch apart.

A mixt. of carbonated cola drink, butter or margarine, and cocoa is heated to the point of boil so that vigorous effervescence occurs. The mixt. is removed from the heat and confectioner's sugar is stirred in (effervescent foaming continues). The hot foaming mixt. is poured over the top of the cake and the hot icing is forced into the holes (by a suitable levelling pressure), when the foaming action forces the icing throughout the highly porous structure. Finally the remaining hot icing is applied to the outer surfaces of the cake.

Inside the unique cake the icing is entrained in the highly porous structure and retains a moist, candy-like consistency. Outside the cake, the icing hardens to a glaze. 23.6.77 as 809082. (4pp478)

KLIN/ ★ D11 · 17931B/09 ★US 4140-800
Freeze-dried sour dough bread starter - prepd. by inoculating flour water mixt. with Lactobacillus sanfrancisco
KLINE L 13.06.77-US-805681
(D16) (20.02.79) A21d-08/04

A freeze-dried sour dough starter is prepd. by inoculating a suspension of flour and water in the wt. ratio 1:1 to 2.5:1 with Lactobacillus sanfrancisco to provide an initial count of $\geqslant 5 \times 10^6$ viable cells per g. of suspension, incubating the suspension, adding $\geqslant 6\%$, based on wt. of final flour culture mixt. of a disaccharide stabiliser, then freezing the mixt. and drying it.

The starter provides high levels of viable cells, and allows the prodn. of sour dough bread without the maintenance of a mother sponge. 13.6.77 as 805681. (23pp955)

Roasting meat by infrared irradiation - in two stages followed by treatment with hot air to improve prod. quality
MOSC MEAT DAIRY IND 08.05.75-SU-131684
(25.05.78) A23l-01/31

Meat is roasted by a two-stage infrared irradiation followed by treatment with hot air. The first stage is carried out with 2-10μ rays (λ_{max}= 3.5-3.8μ); the intensity is 6500-7000 W/m^2, time 2-5 mins. The second stage is carried out with 0.76 - 3.5μ rays (λ_{max}=1.04μ); the intensity is 3600-4000 W/m^2; time 40-45 min.

The final treatment is carried out with air heated to 110-115°C, for 15-20 min. Opt. additional air treatment (110-115°C for 5-8 min.) is carried out between the i.r. irradiation stages to avoid overheating. By this method, the process is accelerated, the quality of the product is improved, and the quantity is increased.

Zhukov, N.N., Kazyulin, G.P., Rogov, I.A. et al. Bul. 23/25.6.78. 8.5.75. as 131684 (2pp70)

Fish lateral bones detector - has ionising emitter and receivers t
position outline of bones and fish prior to severing of the head
POLAR SEA FISH ECON 08.07.75-SU-155616
(22.05.78) A22c-25/14

Bone detector consists of a source of ionizing radiation, detectors, and a conveying unit. The precision with which the coordinates of the bones are determined, and the yield of edible fish production is increased by providing a sensor for the presence of the holding devices on the fish, logic AND scheme and memory, comparison, power, and matching units.

The detectors are distributed on a curve which duplicates the shape of the shoulder bones of the fish, and are connected by means of the matching, power and comparison units to the input of the memory unit. The output of the latter is linked to the logic AND scheme, the input being simultaneously sub-connected to the fish-engagement presence sensor, via a time-matching unit.

Sausage making and cooking installation - has cylinders containing cells into which extruded sausages are placed and rolled through cooking stages
LENGD ROSREMMEKHPRO (LEME=) 04.01.76-SU-307830
(27.03.78) A22c-11

Production line for sausages, has attachments for shaping and heat-treatment, as well as means for conveying the sausages between operations. Productivity is increased and quality of the products is improved by making each means for the inter-operation conveyance as a container in the form of a mesh cylinder, with a collection of cells into which the sausages are placed.

The latter are formed by rods, connected by discs, the edges of which have guiding flanges. The edges of the discs of the container also have holes so that rods can be passed through, the number of holes for them corresponding to the number of cells.

Internal-organs removal from fish sections - during filleting, using disc knives to form sections and vibrating table to separate parts
TEKHRYBPROM EXP PRO 04.02.76-SU-323963
(21.03.78) A22c-25/14

Fish-filleting device, for processing fish to be used in minced preparations and fish conserves, consists of a unit to divide the fish into portions, with a block of disc knives and perforated vibrating table hinge-mounted on supports, to remove the internal organs from the fish pieces. The quality with which the internal organs are removed is increased by mounting the vibrating table so that it vibrates transversely.

The table also has lateral vertical mesh walls. The supports are fastened in pairs and are inclined relative to one another. The meshes in the meshed walls have dimensions smaller than the cross-section of the smallest lumps of fish. The vibrating table also slopes in the lengthwise direction.

Fish smoking oven transporter - with carrying rod ends fitting slots in chain conveyor hangers with rigidly fixed sides
TEKHRYBPROM EXP PRO 23.08.76-SU-398828
(27.03.78) A23b-04/04

A transporter for fish strung on carrying rods comprises an endless chain conveyor having pivotably mounted hangers with rod carriers. To improve oven throughput and reliability, the sides of the hangers are rigidly fixed on bars, and each carrier consists of two plates fixed in parallel on the bars and having inclined slots with round end seats.

Attachment of parts to the bars prevents skewing and chain vibration, eliminates the need for guides and increases conveyor life. The rod length is utilised to the maximum and the slots prevent rods falling out. Such arrangement improves loading mechanisation.

Kravtsov, A.D., Sidorovich, V.V., Slavinskii, N.F. et al. Bul. 14/15.4.78. 23.8.76. as 398828 (3pp1358)

Nutritive protein hydrolysate prepn. - from defatted killer whale meat by enzymatic hydrolysis, useful as dietary supplement
MARINE FISH OCEANOG 09.08.76-SU-391986
(D16) (27.03.78) A23j-01/02

The protein hydrolysate in the form of flour is prepd. from meat of a killer whale by comminuting the meat; subjecting it to enzymatic hydrolysis; inactivating the ferment, sepg. the hydrolysate by filtration; defatting the product and drying.

This method is improved by effecting the hydrolysis with fermentation preparation 'Protelin'(RTM) having an activity of 1000-1100 unit/g. used in a ratio of 1:20-1:40 w.r.t. the proteins. The temp. is 52-53°C. The duration of the process is 6h. Before the filtration, the hydrolysate is cooled and treated with HCl to pH 2.0-2.6 to effect coagulation of the pigments. The product is suitable for medical nutrition etc.

Popov, N.G., Mrochkov, K.A., and Kaverzneva, E.D. Bul. 14/15.4.78. 9.8.76. as 391986 (4pp70)

Sterilisation of rotating meat saw - and arcuate guard using jets of hot water
ARMOUR CO 14.06.77-US-806468 (26.01.76-US-652405)
P62 (20.02.79) A22b-05/20 B26b-25

Animal carcasses supported from an overhead rail pass a cutting station. One of the carcasses is contacted by the rotating blade of a cutting saw to sever the carcass at the cutting station. Water under pressure and ≥180°F is projected against the blade after it is removed from the one carcass to sterilise it prior to contact with a second carcass.

Pref. the cutting saw includes a guard which is also sterilised by heated water. The water is discharged from nozzles arranged about the guard. Pref. the blade is rotated as the water is directed at it.

The sterilisation step is used on a carcass processing line to reduce the risk of cross contamination. 14.6.77 as 806468. (4pp295)

Rapid brewing of syoyu - using solid cultured prod. of Aspergillus mould opt. autolysed or matured

AJINOMOTO KK 20.06.77-JA-073045

(23.01.79) A23l-01/23

The method comprises (1) adding sugar, common salt and the precursor of the fragrant components selected from (a) a solid cultured prod. of Aspergillus mould; (b) the autolysed prod. of (a); (c) the matured prod. of (a), and (d) their insoluble lees, in the enzymically decomposed prod. of soy bean protein, (2) effecting major fermentation aerobically using yeast, and (3) effecting after-fermentation anaerobically using yeast.

Substances (a), (b), (c) and (d) contain the precursor for the fragrant components of 'syoyu' and that by combining them in 'syoyu' material, 'syoyu' showing excellent taste and flavour like natural 'syoyu' can be prepd. by rapid brewing (e.g. in 10-14 days). 20.6.77 as 073045. (5pp5)

TAKE/ ★ D13 17118B/09 ★J5 4010-174

Highly nutritive feedstuff prepn. - by culturing edible mushroom mycelium in rice or wheat straw medium and heating to leach active components into the straw

TAKEUCHI M 17.06.77-JA-071756

C03 (D16) (25.01.79) A23k-01

Prepn. of feedstuff comprises prepg. a culture medium mainly from rice straw or wheat straw; inoculating a seed culture of edible mushroom in order to culture mycelium; and heating the culture medium spread with mycelium at 40-60°C to cause catalytic reaction and thereby to leach the active component in the mycelium into the culture medium.

Since the active components in the mycelium are leached into the culture medium, the feedstuff obtd. has very high nutritive value, and is esp. suitable for cows and horses. The amt. of soy bean or corn can be reduced to half the amt. previously used. As seed culture of edible mushroom there is pref. used Pleurotus, since it spreads on a medium in a short time. The active components include, e.g., enzymes, polysaccharides, polypeptides, 18 kinds of amino acids, vitamin B_2, B_{12}, D_2, etc. Cultivation is conducted under aerobic conditions and is also conducted after sterilisation of the medium. 17.6.77 as 071756. (3pp108)

SHIO/ ★ D13 17119B/09 ★J5 4010-175

Animal feedstuff prepd. from chaff - by pulverising, mixing with molasses, rice bran, water and microorganism and fermenting

SHIOZAWA S 25.06.77-JA-075841

C03 (D16) (25.01.79) A23k-01

Process comprises compacting chaff using a high pressure compressor; pulverising using a hammer mill to break the chaff tissue; and fermenting the chaff under addn. of fermenting microorganism. Since the chaff tissue is broken by the high pressure compressor and hammer mill, it can be readily hydrolysed by the fermenting microorganisms. Specifically, 1000 kg. of the chaff treated as above, 30 kg. of rice bran, 10 kg. of molasses and 100 g. of microorganism are mixed, and water is added until the water content is 60%. The mixt. is fermented. The temp. is 40°C after 6 hrs., 60°C after 10 hrs. and 70-75°C after 24 hrs. In order to keep the high temp. fermentation, the mixt. is stirred and fermented for 12 hrs. to complete the fermentation. Matured feedstuff having sweet fragrance is obtd. which is added to general cpd. feedstuff in an amt. 20-30%. 25.6.77 as 075841. (3pp108)

MITB ★ D13 17120B/09 ★J5 4010-195
Fish feedstuff prepn. - involves pulverising mixt. of (defatted) soybean, water, buffer and microorganism cells, and adding vitamin(s), minerals and salt
MITSUI SHIPBUILDING ENGG (HABU-) 16.06.77-JA-071520
C03 (25.01.79) A23k-01/18

Prepn. comprises (a) pulverising a mixt. of soybean, defatted soybean, water, buffer and microorganism cells to prepare an emulsion; (b) sepg. the impurities such as cellulosic material from the emulsion by filtration; (c) adding to the filtrate complex attracting substance, vitamins and mineral mixt.; (d) gelating the mixt. by addn. of salt; (e) freezing and modifying the gel to make it sponge-like; and (f) melting and dehydrating the melted prod.

The complex attracting substance is, e.g., dried powder of fish intestines, activated sludge, wheat gluten, egg, seaweed, starch, fatty acid, etc. The emulsion is gelated by addn. of a magnesia component, and the gel is then frozen to make the tissue sponge-like.

In use, the frozen prod. is melted and dehydrated to use as raw bait, or the dehydrated prod. is dried to use as dry bait. The feedstuff has a high nutritive value, can be readily digested and promotes the growth of fish and does not cause pollution of water. 16.6.77 as 071520. (4pp108)

Vanillin and heliotropin, prepn. - by oxidn. of 3,4-substd. propenyl benzene cpds. in polar organic solvents and exposure to nuclear radiation
KOMAROV P N 31.07.67-SU-175842
E14 (D23 E13) (12.05.78) C07c-47/52

3-4-substd. propenylbenzenes, namely iso-eugenol (I) and iso-safrole (II), are oxidised with oxygen contg. gases (e.g. oxygen) under the effect of nuclear radiation in solns. of polar organic solvents. The latter include: ethanol dimethylsulphoxide and acetic acid. The process is simple provides a fast reaction rate, and ensures an almost quantitative yield of the final prods. Thus, oxidn. of (I) gives vanillin (III) (widely used in confectionery). Heliotropin (IV) (a valuable raw material in perfume mfr.) is produced by oxidn. of (II).

Under comparable reaction conditions, the rate of oxidn. of (I) in solns. is somewhat faster than that of (II); in both cases the oxidn. rate does not change by increasing the gas feed rate from 2 to 36 litres and depends on the nature of the solvent. The reaction proceeds easily in ethanol and acetic acid solns. and less easily in benzene. The reaction rate depends appreciably on temp. but also varies with a change in concn. of (II). For the reaction in acetic acid soln. the optimum concn. of (II) is approximately 3.0 mole/litre.

A viscous prod. is cleaned from a cylindrical drum which has a central bung hole in one end wall. The drum is supported with the bung hole facing downwardly. The prod. is emptied through the bung hole using a gas stream which is introduced to the drum near its upper end. Residual prod. is washed away using a liq. spray which is introduced from a vertical pipe extending upwardly through the bung hole with its axis parallel to that of the drum.

The pipe includes spaced nozzles which each spray the liq. in a conical jet. The supported drum is rotated about the spray pipe while the liq. is directed towards the interior walls of the drum for washing. 15.8.77 as 824787. (6pp295)

Potato prods. having good colour characteristics - by fermenting before dehydration
FRITO-LAY INC 27.06.77-US-810411 (07.07.75-US-593271)
(20.02.79) A23l-01/21

Potato prods. of good colour characteristics are prepd. as follows: (a) potatoes (reducing sugar (I) content 1wt.%; (I):total sugar ratio $\nless$ 0.6; H_2O content $\nless$ 10wt.%) are fermented in the presence of sufficient H_2O; (b) fermented potatoes are dried at 95-180° to H_2O content < 10wt.%; (c) the resulting potato flakes may then be fried.

Fermentation before dehydration gives potatoes which show a good rate of (I) decline during fermentation. On subsequent rehydration and frying, the prepd. potatoes have a reduced tendency to brown (because of (I) redn.), and have a less yeasty or fermentation taste than potatoes which are fermented after drying. Prepd. potato prods. are stable to storage. 27.6.77 as 810411. (7pp478)

Flower bulb washing appts. - comprises two contacting cylinders with spiral wound perforated hose to convey and wash
WAUTERS M 17.10.78-BE-871318
(15.02.79) A23n

Flower bulbs or similar spherical objects are fed from a hopper onto a pair of parallel cylinders rotating the same sense with a means of conveying the bulbs along the cylinders to a collection chute. During the conveying of the bulbs, they are caused to continuously rotate and may be subjected to a wash spray. In the preferred form, the longitudinal conveying is achieved using a spiral on one of the cylinders. The spiral may be formed by a perforated rubber hose through which the wash water is pumped. The surface of the cylinders is made of a material which will not crush the bulbs. The feed hopper is pref. a downwardly inclined vibrating chute mounted on leaf type springs.

The device is used for washing the soil from flower bulbs, a process currently carried out by hand. It is capable of removing soil from between the bulb and its outer layer of skin without causing any damage to the bulb itself.

An installation for coating the particles of a granulate has a processing drum rotating on an axis inclined to the vertical inside a housing and a stationary spray nozzle. The wall of the drum is formed by a number of curved sections spaced out radially and overlapping each other. Inside the housing, two sealing rails offset at an angle to each other work with the wall of the drum to divide the cavity between drum and housing into two - one connected to the gas inlet and the other connected to the gas outlet. The charge is ejected by reversing the rotation of the drum so that the particles fall through the cavities between the overlapping plates into an outlet funnel.

The design of the wall makes possible considerable savings, partic. of the time necessary to dismantle when the charge is unloaded. 23.2.77 as 707809 (6pp1045).

Fruit and vegetables classifier - with rotating, profiled roller having elastic mesh surface, for better grip and earth removal

MOSC ECONOMY INST 09.12.75-SU-197481

P43 (23.03.78) A23n-15 B07b-13/04

A classifier working member comprises a profiled rotating roller. To improve output and classifying accuracy, the roller is hollow and has a working surface of elastic mesh, pref. of corrosion-resistant material.

The mesh provides additional frictional grip on the fruit or vegetables, and also sieves out particles e.g. of earth. In the event of fruit jamming the mesh can deform so that fruit can be released without damage.

Conversion of charcoal griller to food smoker - by suspending heat absorber from food supporting bars

STEWART W G 06.04.77-US-785189

(20.02.79) A23c-03/02

The cooker has a food supporting surface formed of spaced horizontal bars. A heat absorber reduces the atmospheric temp. in the space immediately surrounding food placed on the bars. The absorber also adds moisture to the space.

The absorber comprises a cavity which forms a heat barrier between a heat generator section and the space surrounding the food. The cavity is in the form of an open-top container holding vaporisable liq. The container is suspended from the bars closely beneath the food to be smoked, using hooks detachably secured to the bars and connected to the container. 6.4.77 as 785189. (7pp295)

WDAI- ★ D14 17762B/09 ★US 4140-270

Removing dense impurities e.g. metal fragments, from food slurry - in centrifugal separator with annular trough trap to collect impurities

WESTERN DAIRY PRODS 07.11.77-US-849071

J01 P41 (20.02.79) B04b-11/06

A centrifugal separator includes a vertical rotating cylinder into which a slurry is fed axially. An impeller mounted within the cylinder engages the slurry and throws it against the cylinder walls. An outlet is located on the cylinder base adjacent the sidewalls and conveys the slurry to a discharge chamber where a pumping vane directs the slurry to an exit port.

Pref. an annular trough in the base of the cylinder collects material from the walls of the cylinder when it is halted after use. A removable housing surrounds the cylinder and includes a non-contacting seal to retain slurry in the discharge chamber.

After use the sepd. impurities fall from the cylinder walls into the trough which thus prevents them from entering the sepd. prod. in the discharge chamber. 7.11.77 as 849071. (10pp295)

Proportional dosing of liq. additive, esp. disinfectant, into water - with safety circuit to stop flow if dosing fails
LANG APPARATEBAU 26.08.77-DT-738531
P34 (26.02.79) A61l B01f C02b

The proportion of additive to main liq. is held constant regardless of changes in the flow of main liq. The equipment uses an hydraulic motor in the pipeline of the main liq. and to drive a volumetric, proportioning pump for additive. The pipework for the main liq. is separate from the pipework for the additive. The hydraulic motor is stopped and started by operating a valve in the outlet pipe of the motor. The valve is actuated to stop the motor when a safety circuit is set to alert condition.

The additive reservoir is fitted with a low level sensor which sets the safety circuit to alert condition when the additive runs out. The alert condition is also set by a pressure switch which operates if the supply pressure of main liq. drops too low to operate the hydraulic motor satisfactorily. The pipe systems for main liq. and for additive are pref. separated just upstream from the point where additive is mixed into main liq. The valve controlling the hydraulic motor is pref. a solenoid valve operated by the safety circuit.

The system is esp. used for adding disinfectants to water for use in hospitals, swimming baths, abattoirs, etc There is no danger of the system operating when the additive runs out or when main liq. pressure is insufficient to ensure correct proportioning. 25.8.78 as 869972 (11pp448)

Removing phenol, thiocyanate, and complex cyanide s) from waste water - in stripping column fed with oxidising agent in addn. to stripping fluid and base; used e.g. for treating coking plant
CENT RECH METAL 20.10.78-BE-871436
H09 (15.02.79) B01d C02c

A stripping column is fed in its upper part by waste water, such as from a coking plant, and in its lower part by a stripping fluid. At a certain level in the column a strong base is introduced to remove volatile pollutants, partic. free and fixed NH_3. In addn. oxidising agent, capable of degrading phenols, thiocyanates, complex cyanides, etc., are introduced. Such oxidizing agents can be those specifically effective in a basic medium, suitable cpds. being H_2SO_5, $(NH_4)_2S_2O_8$, K_2FeO_4 and O_3, or an acidic medium, e.g. H_2O_2, or in both e.g. ClO_2 and/or oxygen, or at pH 6.5-7.5 e.g. NaOCl.

The agents can be introduced at the same level as the strong base, or at a place where the NH_3 has already been removed. When H_2O_2 is used, acids are pref. introduced between the points where free and fixed NH_3 are removed NH_3 vapours from the latter being fed back to the former without contacting the region where the thenols are degraded. 20.10.78 as 871436 (22pp1331)

CNRM ★ D15 16044B/09 ★BE -871-437
Treating effluents from coke mfr. using stripping column - feeding also strong base plus phenol adsorbing agents
CENT RECH METAL 20.10.78-BE-871437
A97 H09 (15.02.79) B01d C02c

The waste water is fed in at the upper part and the stripping fluid at the lower part. To at least one level of the column a lateral introduction is effected of a strong base into a zone for decomposing ammonium salts. A further feature comprises introducing adsorbing agents for phenols and analogous cpds.

Process is partic. applied to effluent from coke mfr. contg. ammonium salts, phenols, thiocyanates and complex cyanides. The improvement of the addn. of adsorbing agents avoids the need for supplementary treatment before discharge, the possibility of pollution, and harmful effects to biological treatment basins. 20.10.78 as 871437 (6pp)

Drinking water filter bed surface layer regenerator - lowers enclosed injectors from floating structure and evacuates disturbed impurities
MULLER H 17.02.75-CH-001944
J01 (15.01.79) B01d-23/24 B01d-35/24

Sand and/or carbon filters as used in drinking water purifying plants have their surface layers regenerated by a floating swilling-out arrangement. This consists of a mantle supported by a buoyant structure which can be raised and lowered. Inside the mantle a number of swilling-out spindles connected to a compressed air and/or a pressurised water supply are fixed, and above the spindles means of evacuating the contaminated water from inside the mantle are provided. At the lower end of the spindles outlets of different inclination are provided, those for compressed air being at the higher level.

The mantle which is rectangular may be supported between two floats at their centre, or there may be a mantle at each end of the structure. The spindles for injecting the swilling-out water and the compressed air are fixed inside the mantle together with feed manifolds, and above them there is a suction chamber connected to a pump for evacuating the contaminated water. A gantry above the floats carries a block and tackle for lifting and lowering the mantle.

Used in slow filtration plants for purifying drinking water, in which the surface layers of the beds become choked after a time. Appts. restores the permeability for water of the surface layers at relatively little cost. 17.2.75 as 001944 (5pp1045)

Microbiocidal prod. comprises a strong base macroreticular anion exchange resin having quat. ammonium functionality and average critical pore dimension of 8000-500000 Å, contg. > 1 partially water soluble salts of Ag, Cu, Hg, As, Zn and/or Pb as microbiocide, esp. AgCl.

Material is prepd. by heating the anion exchange resi pref. in the chloride form, with a water soluble microbicide pref. Ag sulphate, nitrate, acetate, carbonate, oxide and/or tartrate, followed by washing. 16.6.77 as 025154 (7pp931)

ALHA/ ★ D15 16396B/09 ★GB 2002-736

Pyrogen-free sterile water prodn. by reverse osmosis - after pre-filtration by reverse osmosis and ion exchange

ALHAUSER E 17.08.77-DT-737121

B07 (28.02.79) C02b-03/06

Pyrogen-free sterile water is produced from untreated water by pumping the untreated water through a pre-filter and an ion exchanger. After this treatment the water is fed to a reverse osmosis unit to produce sterile water as the permeate. Concentrate from the reverse osmosis unit is returned and mixed with the untreated water upstream of the pump.

Pref. the pre-filter comprise a second reverse osmosis unit whose concentrate is also returned to the untreated water inlet. Optionally a throttled drain removes a portion of the untreated water downstream of the pump to reduce the temp. rise as a result of the pumping operation.

Pyrogen-free water is used for injection, infusion solutions and eye medicaments. Returning the concentrate streams of the reverse osmosis units to the untreated water inlet flushes germs from the membranes thereby preventing their penetration by germ growth. 16.8.78 as 033519 (6pp295)

KORY- ★ D15 16462B/09 ★J5 4006-829

Corrosion prevention compsn. for circulating soft water systems - comprises sodium methylate aliphatic mono:carboxylic acid amide and polyoxyethylene alkylphenol ether

KORYU KOGYO KK 20.06.77-JA-073731

A97 E19 M14 (A25) (19.01.79) C23f-11/14

The compsn. used for a metal contacting circulating water contg. no hardness component e.g. Ca^{2+} or Mg^{2+}, includes sodium methylate, an aliphatic monocarboxylic acid amide and a polyoxyethylene-alkylphenolether.

For the aliphatic monocarboxylic acid amide, C 6-24 may be used, e.g. rauric, oleic, capric or palmitic acid and 5-40(15-25)wt.% together with sodium methylate 5-60-(30-50)wt.% and the ether 5-60(35-45)wt.%. 20.6.77 as 073731. (4pp53)

MITQ ★ D15 16474B/09 ★J5 4006-861

Dehydrating waste sludge contg. colloidal organic material - by treating with ultrasonic waves, freezing, remelting, then drying

MITSUBISHI ELECTRIC CORP 17.06.77-JA-072473

Q75 (19.01.79) B01d-43 B01j-01 C02c-03 C02c-104 F25d-31

The method comprises applying ultrasonic waves to a waste sludge contg. organic substances; freezing the resulting sludge; melting it, and dehydrating it. The organic substance is protein, hydrocarbon, fibre, oil or fat. And the organic substances are contained as hydrophilic colloids in the waste sludge, the sludge is difficult to dehydrate. 17.6.77 as 072473. (3pp51)

KOBM ★ D15 16483B/09 ★J5 4006-873

Cleaning tubular membrane separator - using cleaning ball transfer structure, the separator being used for concn. and desalination of solns. and suspensions

KOBE STEEL KK 20.06.77-JA-073737

J01 (19.01.79) B01d-13 B01d-31

The separator comprises tubular membrane modules arranged in several series of sepn. lines. Each module is cleaned by cleaning balls.

A cleaning ball transfer structure is disposed in the upstream of the series of modules and connected to a raw liq. feed one and conc. drain line formed in each module. The balls are fed to the series of modules from the upstream to the downstream then sepd. from the conc. drain, and fed back to the feed line. 20.6.77 as 073737. (7pp26)

FUJI- ★ D15 16682B/09 ★J5 4007-756

Water-insoluble cpd., e.g. synthetic resin, sepn. from waste water - by adding aluminium sulphate to coagulate resin, and adding sulphuric acid which recovers the aluminium sulphate

FUJI SANGYO PLANT K (NISH-) 18.06.77-JA-072510

A35 (20.01.79) C02c-05/02

A first chemical is added to coagulate and separate water-insoluble substances present in waste water; a second chemical, capable of restoring the reaction prod. from the previous process to the first chemical, is added to the coagulated sludge deprived of its moisture to a certain extent; and the first chemical and the water-insoluble substances are sepd. from each other to recover the first chemical.

This method can perform highly effective treatment of waste water at low running cost due to the recovery of the first chemical, aluminium sulphate, and the reduced amt. of sludge to be discharged, $^1/_{10}$th that of other methods, because the finally discharged sludge contains small amts. of oil and $CaSO_4$. The first chemical is $Al_2(SO_4)_3$ in addn. to the coagulants, e.g. $Ca(OH)_2$ or NaOH, and the second chemical is sulphuric acid. 18.6.77 as 072510. (3pp117)

KOBM ★ D15 16683B/09 ★J5 4007-757

Treating waste aq. suspensions - by passing under pressure through tank with zigzag baffles and intimately contacting with adsorber particles

KOBE STEEL KK 17.06.77-JA-072674

(20.01.79) B01d-15 C02c-05/02

Pollutants present in waste water are adsorbed in an adsorber set in a treatment tank while flowing waste water from one side to another. Waste water becomes a pressurised circulating flow while being forced to flow zigzagly up-and-down among partition walls and baffle plates in a treatment tank. The pressurised circulating flow water is further made to flow upwards in the form of a jet stream from the lower part of the tank, whereupon adsorber particles present in waste water are forced to flow together with waste water, while adsorber particles are concurrently circulated from the other end of the treatment tank to the foremost portion of the tank. During the time part of deteriorated adsorber particles are taken out from the outlet of the circulating path.

This method exhibits good efficiency in continuous operation. It is used to treat urban sewage, factory effluents, river water, sea water, etc. contg. either organic or inorganic material. The adsorber used includes zeolite, ion-exchange resins, activated carbon, active alumina, etc., or other liq. and semi-solid adsorbers. 17.6.77 as 072674. (4pp117)

EBAI ★ D15 16684B/09 ★J5 4007-758

Treating nitrate and/or nitrite-contg. waste water - using a hydrogen donor under anaerobic conditions with a denitrifying microorganism

EBARA INFILCO KK 20.06.77-JA-073153

(20.01.79) C02c-01/02

In the biological denitrification of nitrate and/or nitrite-contg. waste water, in which a hydrogen donor is added to waste water under anaerobic conditions, using denitrifying microorganism attached to granules in a stationary or fluidised bed, the concn. of nitrite in the effluent from the denitrification process is determined in order to control the amt. of the hydrogen donor to be added.

The process is used for the treatment of human waste or factory effluents at low operation cost without causing any environmental pollution. Pref., the hydrogen donor (organic carbon source) is methanol, acetic acid, saccharide, etc.; and the nitrite is determined by the α-naphthyamine-sulphanilic acid method or the N-ethylenediamine-sulphanilic acid method. 20.6.77 as 073153. (5pp117)

EBAI ★ D15 16685B/09 ★J5 4007-759

Controlling organic carbon added in biological denitrification - using monitor column packed with denitrifying bacteria-attached granular solids

EBARA INFILCO KK 20.06.77-JA-073154

(20.01.79) C02c-01/02

In the microorganisms-floating type denitrification of organic waste water contg. nitrate and nitrate nitrogen to which an organic carbon source is added, comprising a digestion process and a denitrification process, a part of the effluent from the digestion process is taken out to add an organic carbon source, e.g., methanol, and then the waste water thus treated with the organic carbon source is passed through a monitor column packed with denitrifying bacteria-attached granular solids to determine the concn. of nitrite nitrogen present in waste water, so that the addn. of an organic carbon source to the biological denitrification process can be controlled.

Specifically the method of determining the concn. of nitrite nitrogen in waste water used is the α-naphthylamine-sulphanilic acid method or the N-ethylenediamine-sulphanilic acid method.

Method is capable of rapidly detecting the concn. of nitrite nitrogen present in waste water and therefore of controlling the amt. of the organic carbon source to be added to the denitrification tank. Process is applicable to the treatment of urban sewage or industrial effluents. 20.6.77 as 073154. (3pp117)

HIEJ ★ D15 16686B/09 ★J5 4007-760

Purificn. of oily waste water e.g. coolant water - using mineral acid and opt. emulsion breaker, and reverse osmosis of aq. phase

HITACHI PLANT ENG CONST 20.06.77-JA-073648

A97 (20.01.79) C02c-05/02

A mineral acid opt. contg. an emulsion breaker are added to oily waste water to separate into aq. phase and oil phase, and then the aq. phase thus obtd. is subjected to reverse osmosis treatment. The mineral acid includes H_2SO_4, HCl, etc., and the emulsion breaker used also includes anionic surfactants of higher fatty acid alkali salts, cationic surfactants of halogenated higher amine salts, nonionic surfactants of polyethyleneglycolalkylether, aliphatic monoglycerides, etc., and amphoteric surfactants of amino acid, etc.

Treated waste water has a very low concn. of COD components, BOD components and SS components, which brings about no environmental pollution. Treatment is highly effective, economical and efficient. 20.6.77 as 073648. (3pp117)

HIEJ ★ D15 16687B/09 ★J5 4007-761

Fluorine-contg. waste water purificn. - by adding calcium salt and then slaked lime, and removing ppte. formed

HITACHI PLANT ENG CONST 20.06.77-JA-073649

(20.01.79) C02c-05/02

A Ca salt is added to the waste water the pH of which is 1-7(4-5), then slaked lime is further added to the waste water so as to regulate the pH range to 8-11, and the ppte. formed is removed. Ca salts used include $CaCl_2$, $CaBr_2$, CaI_2, $Ca(NO_3)_2$, etc., and the amt. of Ca salt added is nearly equiv. to the possible amt. of fluorine present in waste water. A coagulant, e.g. Al sulphate, etc. may be added to waste water after slaked lime has been added.

The method, which lowers the content of fluorine to $\leqslant$ 10 ppm. and the amt. of sludge discharged to $^1/_2$-$^1/_{10}$ that of the conventional methods, is effectively applicable to the treatment of the effluents from electronics parts mfg. factory, atomic power plants and related industry, foundry, etc. at lower operation cost due to redn. of the cost for concentrating, drying and dumping sludge. 20.6.77 as 073649. (3pp117)

HIEJ ★ D15 16688B/09 ★J5 4007-762

Purificn. of fluorine cpd.-contg. waste water - by passing through calcium salt packed column and regulating pH by addn. of slaked lime

HITACHI PLANT ENG CONST 20.06.77-JA-073650

(20.01.79) C02c-05/02

A waste water of pH 1-7(3-5) is passed through a Ca salt-packed column, then the pH of the waste water is further regulated to 8-11 by the addn. of slaked lime to ppte. CaF_2, and lastly the ppte. is removed to the outside.

The method reduces the concn. of fluorine in waste water to approx. $\leqslant$ 10 ppm. at low running cost. The waste water is e.g., those discharged from electronics parts mfg. industry, molten salt electrolytic industry, atomic power-related industry, foundry, etc.

The Ca salt used includes $CaCO_3$, lime, $CaCl_2$ chloride, $CaBr_2$, CaI_2, $Ca(NO_3)_2$, etc. 20.6.77 as 073650. (3pp117)

NIPS ★ D15 16755B/09 ★J5 4008-166

Removing heavy metals from exhaust smoke treating soln. - by pptn. as hydroxide(s) by pH adjustment, then chelating remainder

NIPPON SODA KK 22.06.77-JA-074051

(22.01.79) C02c-05/02

The heavy metals in treatment soln. are pptd. as hydroxides by adjusting pH value of soln. to 8-10 and the resulting pptes. are removed. Further heavy metals contained in the soln. are pptd. as chelate cpds. by adding chelating agent after adjusting pH of soln. to 1-11, and resulting ppte. is removed.

Used for treating soln. contg. large amt. of heavy metal, esp. Hg. Further, by-prod. salts obtd. by evaporating the treated soln. may be used for various industrial materials. 22.6.77 as 074051. (6pp96)

Treating heavy metals-contg. effluent - by contact with yellow ochre
AGENCY OF IND SCI TECH 22.06.77-JA-073993
J01 M25 (24.01.79) C02c-05/02

Heavy metal components, e.g. V, Ni, Hg, Pb, Cr etc., are effectively and economically removed by adsorption from effluent by contacting the effluent with Yellow ochre (natural occurring low cost yellow pigment composed of noncrystalline Al silicate contg. iron oxide hydrate, comprising 6-12% binding water, 30-60% SiO_2; 5-15% Al_2O_3 and 20-60% Fe_2O_3), the amt. of which is 20-2,000X (by wt.) that of the heavy metal components.

The yellow ochre may be first calcined at >110 (esp. 500-550)°C, and it is pref. used in form of powder or granules having the granular size of 50-1,000 (100-500) μ.

In an example, 1 g. of yellow ochre was added to 50 ml. of aq. soln. contg. 100 ppm. of heavy metals (Pb, Cr, Hg, V), followed by agitation for 60 mins. and filtration. The metal removability are as follows: Pb 74%; Cr 61%; Hg 93%; V 83%. 22.6.77 as 073993. (2pp34)

EBAI ★ D15 17057B/09 ★J5 4009-452
Removing BOD and organic nitrogen components from waste water - using excess recycled activated sludge, hydrolysed with alkali, as hydrogen donor
EBARA INFILCO KK 22.06.77-JA-074268
(24.01.79) C02c-01/02

Purificn. of waste water is effective by utilisation of surplus amt. of activated sludge resulting in the system as hydrogen donor without any use of hydrocarbon, e.g. MeOH etc.

Process comprises transferring the waste water in succession to, initial denitrification vessel, nitrification vessel and to secondary denitrification vessel; sepg. the water thus treated into treated water and conc. activated sludge; recycling a portion of the sepd. conc. activated sludge to the initial denitrification vessel; introducing the remainder of the activated sludge (as the surplus amt. of the sludge) into a hydrolysing vessel where it is treated with a monovalent alkali metal cpd., e.g. NaOH, KOH, Na_2CO_3 or K_2CO_3 etc. under elevated temp. to solubilise by hydrolysis organic matters contained in the sludge; sepg. the alkali hydrolysed liquor into solids (filter cake) and sepd. liquor which is then recycled as hydrogen donor to the secondary denitrification vessel. 22.6.77 as 074268. (3pp34)

E14 (17.03.78) C02c-05/10

Waste water contg. aromatic nitro cpds. is purified by preliminary mixing with residues, anaerobic treatment and final aerobic purifcn. The process is simplified, and cost is reduced, by using raw residues of household sewage in proportion 10 pts. residue to 1pt. nitrocpds., and anaerobic treatment is applied to the residue remaining after separation of water.

NOVO ★ D16 15971B/09 ★BE -869-869
Glucose isomerase activated by water-soluble iron salt - is converted into dried particles before use
NOVO INDUSTRI A/S 23.08.77-US-827030 (23.08.77-GB-035368)
(D17) (21.02.79) C12d C13k

A cellular mass of glucose isomerase (which can conform to BP 1516704 or USP 3980521) is activated by the incorporation of at least 0.05 wt.% (on the dry base) of Fe in the form of a water-sol., non-toxic, pref. solid. Fe salt After incorporation of the Fe, the glucose isomerase is converted into particle form and dried.

At least 0.5 wt.% MgO, w.r.t. the dry wt. of the cellular mass, and 2 wt.% of solid glucose are pref. mixed with the Fe before addn. to the cellular mass. The mass is then extruded into granules.

The prod. is used to isomerise glucose. The method avoids the use of (toxic Co), at the same time allowing the Fe to be introduced with the enzyme, and causing it to remain firmly bound throughout the use of the enzyme. 21.8.78 as 869869 (34pp1331)

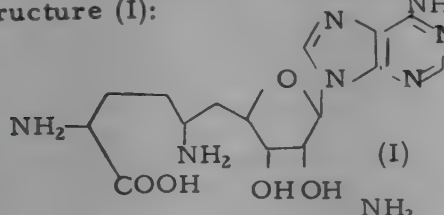
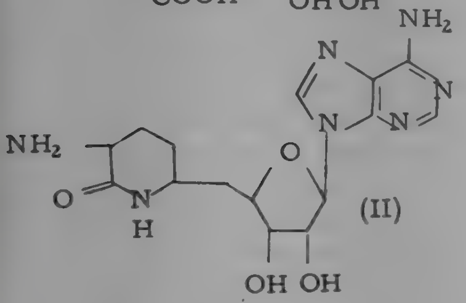
B02 C02 (22.02.79) C07d-405/14 C07d-475

A new diaminoacid, designated 32232RP, has probable structure (I):



(I)

It can exist in the form of an inner salt. Also new are the metal salts and acid-addn. salts of (I) and its lactam (35391 RP) of formula (II):



(II)

(I) is an amorphous white powder readily soluble in water, sparingly soluble in methanol or DMF and almost insoluble in acetone. It has m.pt. 281°C, analysis C 48.0%; H 5.8%; O 21.0% and N 25.2% and has characteristic UV, IR, 1H-NMR and ^{13}C-NMR spectra (reproduced). On silica gel t.l.c. plates developed with 60:30:10 v/v/v methanol-1,2-dichloroethane- 11N NH_3 it has Rf - 0.20.

(II) is a white microcrystalline powder soluble in water at 10 mg/cc and analyses C 49.6%; H 5.8%; O 17.6%, N 27.0% with empirical formula (mass spectroscopy) $C_{15}H_{21}N_7O_4$. Its spectra are also reproduced and in the t.l.c. system specified it has Rf = 0.70.

(I) and (II) are active in vivo and in vitro against fungi and yeasts. Their oral LD_{50} in mice is $\geqslant$1g/kg and they are esp. useful in human medicine for treating Candidosis (of the mouth mucosa, intestines or genitalia) or internal mycoses. The usual oral adult dose is 1-10 g/day. 11.8.77. as 736238 (50pp1251)

BIER- ★ D16 16150B/09 ★DT 2736-281
Pressurised beer tank fitting - combines charging, discharging and vent valve in one unit (NL 13.2.79)

Q34 Q39 (22.02.79) B65d-87/44 B67d-01/04 C12l-11

A fitting for charging and discharging a pressurised tank contg. a carbonated beverage, e.g. beer, in a foil bag includes a charging valve, a discharging valve designed as a spring-loaded non-return valve, and an antechamber leading to a vent valve. Both the discharging valve and the charging valve are designed as integral parts of the fitting.

This simplifies the design and saves time because its operation requires no interchange of any loose parts. 11.8.77. as 736281 (15pp39)

BIER- ★ D16 16151B/09 ★DT 2736-282
Beer tank charging system - with storage tank and pump for gas other than air on road tanker (NL 13.2.79)
BIERDRIVE AG 11.08.77-DT-736282
A92 Q34 Q39 (22.02.79) B65d-87/44 B67d-05 C12l-11

A system of charging tanks from road tankers with a pressurised carbonated beverage such as beer uses instead of compressed air a supply of carbon dioxide and a gas pump on the tanker to charge a foil bag before the tank is filled with beer. Gas displaced by the filling operation is received back. This prevents any possible deterioration of the beer quality by diffusion of air through the foil bag into the beer.

Suitably each of the tanks in the cellar of an inn has a pressurised gas space which is sepd. from the space taken up by the foil bag with beer, by a foil partition. This foil is large enough to enable the enclosed gas space to be varied from zero to the entire internal volume of the tank. This foil can also be designed as a separate gas foil bag. A pref. material for it is a thermoplastic material such as polyethylene. N_2 or a rare gas could also be used instead of CO_2. 11.8.77. as 736282 (18pp39)

BIER- ★ D16 16152B/09 ★DT 2736-283
Spherical storage tank mount - with tubular ring below equator restrained by abutments and suspended from pivoted hooks
BIERDRIVE AG 11.08.77-DT-736283
+Q39 (22.02.79) B67c-09 B67d-01 C02d-01 C12l-11

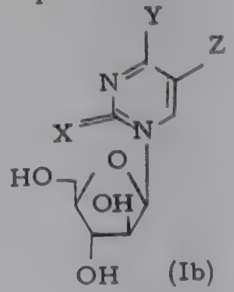
A turn-over mount for a spherical tank for the storage of a carbonated beverage, e.g. beer, consists of a tubular ring of a smaller inner dia. than the equatorial dia. of the spherical tank. The ring is suspended on hooks with pivots in the equatorial plane from a stand. Abutments on the tank which leave a little clearance prevent it from dropping out in the 180° inverted position.

This permits the tank to expand depending on the degree of filling of its foil bag and on the pressure of the gas in the rest of the tank. 11.8.77. as 736283 (8pp39)

AJIN ★ D16 16275B/09 ★DT 2835-151
Purine arabinoside(s) enzymatic prodn. - by reacting arabinose donor with purine source in presence of bacterial enzyme, useful as agrochemicals and therapeutic agents (NL 13.2.79)
AJINOMOTO KK 11.01.78-JA-001802 (10.08.77-JA-095766)
B02 C02 (22.02.79) C07h-19/16 C12d-13/10

In the prodn. of purine arabinosides, an arabinose donor and a purine source are reacted in an aq. medium at 40-70°C in the presence of an effective amt. of a bacterially-produced enzyme capable of transferring arabinose from the arabinose donor to the unsubstd. or 2,6 and/or 8-substd. purine of the purine source until the β-D-arabinofuranosyl residue is bound to the 9-position of the unsubstd. or 2-, 6- and /or 8-substd. purine, and the resulting unsubstd. or 2-, 6-and/or 8-substd. 9-(β-D-arabinofuranosyl)-purine is recovered.

The arabinose donor is D-arabinofuranose 1-phosphate (Ia) or a cpd. of formula (Ib) or its phosphate.



(Ib)

(where X is O, S or NH; Y is OH, NH_2, SH or SR (R=lower alkyl); and Z is H halogen, NO_2, CH_3 or CH_2OH). The purine source is an unsubstd. or 2,6- and/or 8-substd. purine or its ribofuranoside, ribofuranotide, deoxyribofuranoside or deoxyribifuranotide. 9-(β-D-Arabinofuranosyl)-2-chlorohypoxanthine and 9-(β-D-arabinofuranosyl-2-methylhypoxanthine are new and claimed.

Purine arabinosides are useful as agricultural chemicals and therapeutic agents. Adenine arabinoside has been used in the treatment of various herpes infections. 10.8.78. as 835151 (+28.12.77-JA-158738) (39pp280)

STRK ★ D16 16328B/09 ★FR 2392-114
Treating wine making residues to recover alcohol and calcium tartrate - avoiding polluting effluent and with better yields
STORK FRIESLAND BV 15.10.76-IT-028372
(26.01.79) A23k-01/06 C05f-05 C07c-59/14 C12f-03

The wire dregs are treated by putting them into pellet form eliminating alcohol and recovering the alcohol from the liquor extracted, roasting the residue and grinding it, continuously forming a suspension of the residue in hot water or aq. mineral acid solns. and then recovering calcium tartrate from the suspension.

The putting pellet form enables direct removal of the alcohol without dilution. The roasting step results in a coagulation of the yeasts, colloidal substances and colourants making them insoluble thereby avoiding pollution by having a reject liquor with a high B.O.D. Also the yield of calcium tartrate is higher than previous processes (96% as against 70-75%). 14. 10. 77 as 031071 (9pp597)

EGRE/ ★ D16 16329B/09 ★FR 2392-115
Winemaking maceration process of the carbonic type - separates pendicles from whole grapes by hydrodynamic shock wave from positive rotary pump
EGRETIER M 26.05.77-FR-017294
(26.01.79) C12g-01

The system is a carbonic maceration system in which uncrushed grapes are deposited in vessels precharged with carbon dioxide. The pendicles are detached and sepd. from the berries from which a fraction of the must is obtained while they are suspended in and surrounded by a mass of incompressible liq. which projects the berries.

Pendicle detachment is effected by periodic, hydrodynamic shock waves to which the grapes are subjected by a pump delivering them to a fermenting vessel. The must is pref. satd. with CO_2 gas by injection into the pump discharge pipe immediately downstream of the pump. The installation pref. combines in series a reception hopper for harvested grapes, a screw feeder of which the screw pitch increases in direction of dischage, ensuring that grapes are conveyed without crushing, and a positive, rotary pump delivering to an outlet well above the level of the pump.

Used for carbonic maceration of grapes for partial release of must without crushing the grapes. Danger of uncontrolled, irregular fermentation, which can follow crushing of grapes at the bottom of a heavy layer, leading to lactic contamination, is now eliminated. Colour intensity is greatly increased and prod. taste improved. 26. 5. 77 as 017294 (9pp448)

DSIL/ ★ D16 16330B/09 ★FR 2392-117
Continuous crystalliser to extract crystals from wine by cooling - has pipe connections creating flow conditions for rapid crystal settlement
RIBEIRO DA SILVA A 28.06.76-FR-019635
(26.01.79) B01d-09/02 C12h-01/06

The crystalliser takes the form of a temp. controlled vessel with inlet and outlet pipes for wine which are disposed so that the liq. passes through the vessel with a rising, turbulent, circulatory motion. Entrained microcrystals start to rise through already-formed, descending crystals. The crystals agglomerate with the microcrystals which they meet and the enlarging crystals settle towards the bottom of the vessel to be removed via a purge valve.

The vessel is pref. a vertical, cylindrical shell with acutely coned base section and a less acutely coned upper section. The wine inlet pipe pref. delivers tangentially at the lower end of the cylindrical section of the vessel. The outlet pipe pref. extracts from the top of the coned upper section.

The crystalliser is designed for continuous, flowline operation. The flow arrangement produces very rapid deposition of crystals and ensures sepn. of microcrystals. 28. 6. 76 as 019635 (5pp448)

*A96 B04 (28.02.79) *DT2603-120 C07c-103/50 C07c-125/06 C07g-07 C08g-69/48*

Cpd. useful as cytotoxic agent or intermediate in the prepd. of the parent patent cytotoxic agent, comprises a polymer carrier, suitable for binding to ammunoglobulin, having a mol. wt. of 5000-500000 add 5-500 molecules of cytotoxic drug covalently bound thereto.

The cpd. has formula $A\{B\text{-}CD)_m$ where A is polymer carrier e.g. dextran activated with cyanogen bromide to form cycloimidocarbonate and functionalised with $-NH(CH_2)_xCO_2H$, $-NH-(CH_2)_x-NH_2$ where x is 3-8; aminoethylated dextran; polyglutamic acid or fibrinogen; CD is covalently bound cytotoxic drug e.g. N- {p- { [2, 4-diamino-6-pteridinyl methyl] methylamino} - benzyl} -L- glutamic acid, p- [N, N-bis(2-chloroethyl)] phenylenediamine or cytosine arabinoside. B is a peptide linkage between a free carboxyl gp. of the polymer carrier and the free amino gp. of CD, or between a free amino gp of the polymer carrier and the free carboxyl gp. of CD or the covalent linkage between a cycloimidocarbonate gp. of the polymer carrier, when the polymer is activated dextran, and the free amino gp. of the CD; and m is 5-500. 2.2.76 Div. ex 1541435 (14pp984)

CHEM- ★ D16 16413B/09 ★GB 2002-814
Cultivating animal cells as monocellular layer - on cage of tubes rotating in drum of nutrient medium, the tubes pref. contg. additional polycarbonate or glass supports
CHEMAP AG 16.08.77-CH-010058
A96 (28.02.79) C12k-09

Cells of animal tissues are cultivated as a monocellular layer in a tubular element. The tubular element is rotated about a shaft together with an array of similar tubes which extend horizontally. While the tubes are rotated they pass through a nutrient medium enclosed within a drum which surrounds these tubes.

Pref. the ends of the tubes are engaged by apertured discs which may carry O-rings to allow the tubes to be easily removed. Opt. star-like supports made of polycarbonate may be located within the tubes to increase the cultivating area.

The appts. has a large area of concave surfaces and uses a minimum quantity of nutrient medium in the drum. 9.8.78 as 032767 (7pp295)

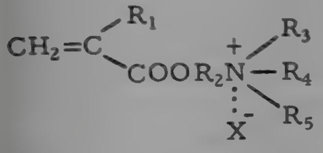
NITO ★ D16 16916B/09 ★J5 4008-788

Fixing enzymes or microbial body - with amphoteric electrolyte-type polymer

NITTO BOSEKI KK 15.06.77-JA-070718

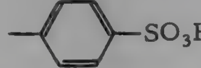
B04 (23.01.79) C07g-07/02 C12k-01

Method comprises radical copolymerising cationic monomer (I) and anionic monomer $CH_2=C(Y)(R_6)$ (II) in the presence of a crosslinking monomer having two ethylenic unsatd. bonds intramolecularly in an aq. medium contg. enzymes or microbial body.



$CH_2=C(R_1)COOR_2\overset{+}{N}(R_3)(R_4)(R_5)\ X^-$ (I)

(III)



(IV)

R_1-R_6 are H atom or methyl; R_2 is ethylene or $-CH_2CH(OH)CH_2-$; R_3, R_4 are (m)ethyl; R_5 is $-C_nH_{2n+1}$ or gp. (III); X is Cl, Br, OH, $-CH_3SO_4$, $-CH_2SO_3$ or $\frac{1}{2}SO_4$; Y is carboxyl, sulpho or gp. (IV), their alkali metal salt or their ammonium salt.

As it has the properties of an amphoteric electrolyte, the polymer has affinity for enzymes and hydrophilic properties and with crosslinking agent it can be made water-insoluble. Further by selecting the proportion of the monomers (I) and (II) the electric charge of obtd. polymer can be freely controlled to match the properties of any enzyme to be fixed. 15.6.77 as 070718. (8pp5)

AMAN ★ D16 16917B/09 ★J5 4008-790

Bacterial prepn. of beta-amylase - by culturing Bacillus polymyxa in a medium of high carbon source concn.

AMANO PHARM KK 17.06.77-JA-070989

B04 (23.01.79) C12d-13/10 C12k-03

Method comprises culturing Bacillus polymyxa in the culture medium having high carbon source concn. The culture is effected at 36-40°C from the start to the maximum multiplication of bacterial body and at 30-34°C afterwards.

Accumulation of viscous substance can be suppressed and accumulation of β-amylase can be increased. Bacillus polymyxa No. 55 FERM-P 3952, B. polymyxa ATCC 8523, etc. are used. The culture is pref. at pH 6.0-7.0 with aeration. The carbon source concn. in the culutre medium is made >6% (10-20%). 17.6.77 as 070989. (4pp5)

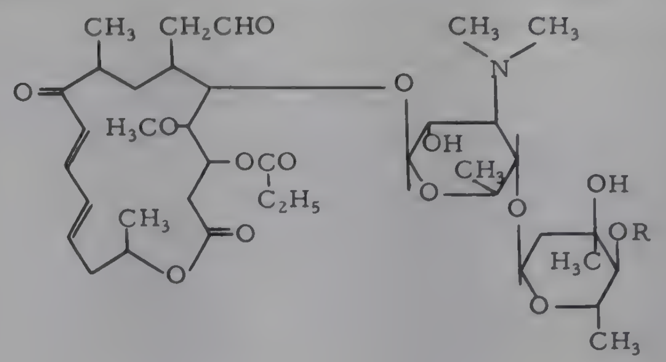
Biochemical prepn. of macrolide antibiotics SF 837A-1 and SF-837A-2 - in which SF-837A-3 or SF-837A-4 is contacted with actinomycetes to reduce carbonyl to hydroxy gp.

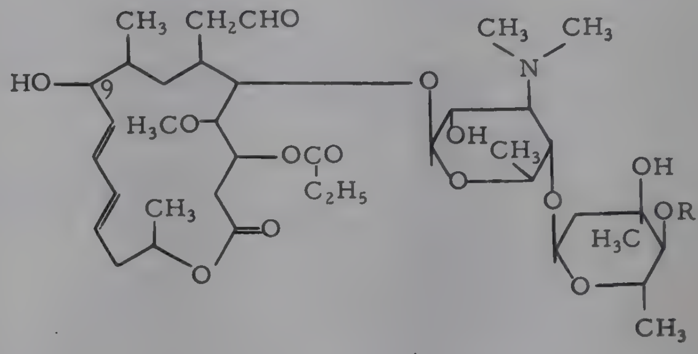
MEIJI KK 16.06.77-JA-070466

B03 (23.01.79) C12d-09/14 C12d-13

Biochemical prodn.of an antibiotic SF-837A_1 or SF-837A_2 of formula (II) (where R = COEt or COPr) comprises contacting a substance SF-837A_3 or SF-837A_4 (I) with the organism of Actinomycetes or its ground one or an enzyme isolated from it to reduce the carbonyl at the 9-posn. to hydroxy,



(I)



(II)

The actinomycetes include Streptomyces mycarofaciens SF-837 (FERM-P 262), Streptomyces lavendulae SE-330 (FERM-P 93), Streptomyces mycarofaciens SF-837 mutant MDM-6 (FERM-P 4065). The reaction is conducted at pH 4.0-7.0. The enzyme contacts with (I) in the presence of a reduced type pyridine nucleotide. 16.6.77 as 070466. (10pp52)

YAMS ★ D16 16920B/09 ★J5 4008-794

5-Adenosyl-L-methionine prepn. - by contacting methionine and ATP with a dry microorganism such as Candida or Saccharomyces

YAMASA SHOYU KK 17.06.77-JA-071128

B02 (23.01.79) C12d-13

Prodn. of S-adenosyl-L-methionine comprises contacting methionine and adenosine triphosphate (ATP) with a dry organism of microorganism which produces S-adenosyl-L-methionine from L-methionine and ATP in an aq. soln. Such microorganisms include Candida, Mycotorula, Saccharomyces, Torula,. Pichia, Debaryomyces, Rhodotorula, Torulopsis, Hansenula, Kloechera.

The organism is dried by acetone dehydration, lyophilisation or air drying. The content of methionine in the reaction medium is kept at >0.1(4-8)mM. The ATP content is kept at >0.1(5-10)mM.

S.Adenosyl-L-methionine is useful as chemotherapeutic agent effective to metabolic disturbance such as hypercholesterolaemia, arteriosclerosis, depression, neuropathic pain of degenerative arthopathia, agrypnia, etc. 17.6.77 as 071128. (9pp52)

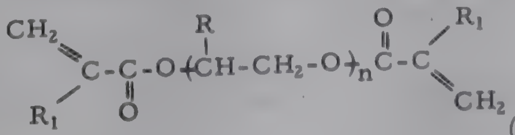
ASAH ★ D16 16988B/09 ★J5 4009-184

Adsorbent for removing organics in protein - obtd. by copolymerisation of a bridging polymerisable monomer and a cyano-contg. monomer

ASAHI CHEMICAL IND KK 24.06.77-JA-074517

A97 (A12 A14 A25 D13) (23.01.79) A23j-01 B01d-15 C07g-07 C07g-11

An adsorbent for removing organics adsorbed in protein comprises a porous copolymer having an average borehole dia. of 40-9000 Å which is obtd. from the copolymerisation of a mixt. of 2-99wt.% of a bridging polymerisable monomer, e.g., divinylbenzene, having the formula (I)



$CH_2=C(R_1)-\overset{O}{\overset{\|}{C}}-O(CH(R)-CH_2-O)_n\overset{O}{\overset{\|}{C}}-C(R_1)=CH_2$ (I)

(where R_1 and R_2 are H or Me gp., and n is 1-30), and 1-98wt.% of a cyano-contg. monomer, e.g., acrylonitrile of formula $CH_2=C(CN)(R)$ (where R is H, alkyl, etc.), and the organics adsorbed in protein can be removed by simply mixing the adsorbent with an aq. soln. contg. the organics-adsorbed protein.

Method is applicable to the purificn. of all culture liqs.

in the fermentation industry and also to other animal blood refining. 24.6.77 as 074517. (9pp117)

Enzyme inhibitor KM-2753, for inhibiting human blood elastase - prepd. by aerobic culture of streptomyces noboritoensis KM-2753 in medium contg. aliphatic carboxylic acid
KITASATO RES INST 21.06.77-JA-073665
B04 (24.01.79) C07g-07/02 C07g-17 C12d-13

An enzyme inhibitor, KM-2753 which inhibits human blood elastase has the following characteristics: (1) consists of C, H and O; (2) is oily at ambient temp.; (3) shows a specific rotation: $[\alpha]^{18}_{D}$ = -0.9° (c = 1, ethanol); and gives specific UV and IR spectra.

The enzyme inhibitor is prepd. by culturing Streptomyces noboritoensis KM-2753 in a nutrient medium contg. 5-20 µg/ml. of a higher satd. aliphatic carboxylic acid at 25-30°C for 50-120 hrs. under aerobic conditions. 21.6.77 as 073665. (11pp16)

MURA/ ★ D16 17114B/09 ★J5 4010-156
Basidiomycetes fruit mass prepn. - by addn. of acidic protease inhibiting agent to culture medium or young fruit mass
MURAO S 18.06.77-JA-072693
P13 (25.01.79) A01g-01/04 C07g-07/02 C12d-13 C12k-01

Basidiomycetes includes, e.g., Cortinellus, Pleurotus, Collybia, Armillaria, mushroom, Auricularia. Cultivation is in a conventional manner and the culture medium contains a carbon source, nitrogen source, inorganic salts and minor nutritive elements necessary for the growth of fungi. After inoculation, cultivation is carried out at 20-25°C in order to propagate the fruit mass, and then the temp. is adjusted to 10-15°C which is suitable for the generation of the fruit body rudiment.

The acidic protease inhibiting agent pref. has the formula R-Val-Val-AHMHA-Ala-AHMHA-COOH (where AHMHA is 4-amino-3-hydroxy-6-methyl-heptanoic acid; R is carbonyl). The agent is prepd. by cultivation of a microorganism belonging to the Streptomyces class. The agent can be used in the form of salt or ester, and it used in an amt. of 2-20 µg per g. of the medium.

The acidic protease-inhibiting agent greatly promotes the growth of Basidiomycetes fruit mass, and as a result the cultivation period is shortened. 18.6.77 as 072693. (4pp108)

HOKK- ★ D16 17117B/09 ★J5 4010-171
Prepn. of compost for use as soil conditioner or fertiliser - by adding concentrate of waste water from sugar beet mfr. to bark of needle-leafed tree and adding bark-decomposing microorganism
HOKKAIDO TOGYO KK 27.06.77-JA-075575
C04 (25.01.79) C05f-05 C05f-09/04 C05f-11

Prepn. of compost comprises (1) adding a conc. of waste water exhausted from sugar beet mfr. to the bark of needle-leaved tree; and (2) adding a bark-decomposing microorganism.

Addn. of the concentrate promotes fermentation. The bark is readily humidified and a matured compost obtd.

In an example, 500 kg. of waste water conc., 2000 kg. of raw excrements of hen and 5 kg. of the decomposing microorganism ZS 42 are added to 10,000 kg. of pulverised bark, and water is added to a water content of ~50%. The mixt. is piled. After 3 days, the temp. becomes 65°C. After one week, the mixt. is stirred and water is supplied. After stirring, the temp. becomes > 70°C. After two weeks, the mixt. is stirred and 100 kg. of the waste water concentrate is added after dilution. After two weeks the mixt. is stirred and water is supplied. The mixt. is then matured for 2 months at 57-60°C. 27.6.77 as 075575. (7pp108)

Potato virus serodiagnosis chamber - has movable sections, matching inlet and outlet holes
POTATO IND RES 08.06.73-SU-930119
C03 (22.03.78) C12k-01/04

The chamber for field tests in the potato viruses serodiagnosis maintains constant humidity and ensures process continuity. The chamber is fitted with movable sections whose vertical walls feature a contour matching the inlet and outlet holes of the chamber.

The movable sections close the inlet and outlet of the chamber thus preventing its ventilation and loss of humidity. The slides with the drops of the reagent are placed on the movable sections inserted into the chamber and the humidity is set by a damp filter paper at the bottom of the chamber. The holding time is 20-30 min. corresponding to the incubation period, and the chamber allows 120-180 analyses per hour to be carried out.

Microorganisms pressure disintegrator - has pressure setting valve and two chambers separated by diaphragm
PROTEIN BIOSYNTH 12.01.73-SU-872033
P41 (17.04.78) B02c-19 C12k-01

The disintegrator of microorganisms for the separation of cell protein, ferments or nucleic acids features an automatic valve for maintaining a set pressure in the vessel. The metering pump feeds the microorganism suspension and compressed gas, while the disintegrator comprises two chambers separated by the diaphragm.

The working chamber has a valve closing needle carried by the diaphragm, and its housing is connected to a flange and the seat for the needle. The vessel holding the suspension under pressure features a heat exchanger ensuring continuous and intensive disintegration of microorganisms.

Frozen microbiological specimen sampler - includes shell with movable bottom and cleaver above funnel holding heaters
LENINGRAD PLEKHANOV MINE 27.05.75-SU-137714
R16 (22.05.78) C12k-01/10 G01n-01/10

Pure sampling from frozen microbiological specimens is ensured by using a container shell with a movable bottom, and ice cleaving unit set between the latter and the shell. Beneath the bottom is a heater with a guide cylinder and a top funnel carrying heating elements, while the throat holds a tube for draining the liquid.

The frozen specimen is placed on the bottom inside the shell, and the cleaver separates the lower end of the specimen. Then the bottom with the separated part is moved to the side, and the sterilised funnel is brought to the cleavage surface of the specimen. The drain tube is connected to the sterile receiving vessel in the burner flame, the heating elements are switched on, and the inner part of the specimen is thawed out.

Fermenting brewer's wort - by water dilution after normal foam collapse during fermentation

SCHLITZ J BREWING CO 03.03.77-US-774028 (11.11.75-US-630803)

(20.02.79) C12c-11

An alcoholic drink is prepd. as follows: (a) an aq. mixt. of fermentable carbohydrates (I) (solids content 19-36° Plato) is placed in a fermentation vessel with the liq. occupying 50-85% of the original vessel vol.; (b) yeast is added, and the mixt. is fermented so that initially the head of foam generated occupies the headspace of the vessel; (c) a subsequent decrease in (I) consumption causes the foam head to collapse; (d) H_2O is added (to dilute the substrate to equiv. initial solids content < 18° Plato) after the rate of fermentation begins to decrease and when the (I) content is 30-70% by wt. of its original value; (e) the diluted wort (occupying a much greater vol. than the original vol.) is then fermented further in the same vessel under the same conditions to the desired end gravity.

By use of the H_2O dilution step (d) it is possible to use the head space of the fermentation vessel which is normally only used for the initial foam generation. Hence, productivity is increased without the use of extra equipment. In addn., the dilution reduces the osmotic pressure across yeast cells, allowing EtOH to be released from the cells and the complete conversion of (I) within the normal fermentation period. The dilution method is applicable to all foam-producing fermentations, including those for beer, malt beverages, wine, distd. spirits, or antibiotics etc. 3.3.77 as 774028. (6pp478)

MITSUBISHI ACETATE 20.06.77-JA-073084
A88 J01 P15 (A11) (20.01.79) A24b-15/02 B01d-39/16 B01d-53/02

Acetate filter is composed of porous cellulose acetate fibres. The fibres are prepd. e.g. by swelling dry spun acetate threads with a mixt. of a solvent capable of solubilising acetate and one not capable, and then treating with steam to form voids (micropores) in the fibres. The filters show a removal rate for tar and nicotine at least equal to conventional acetate fibres and a gas adsorption capacity at least equal to activated carbon or molecular sieve. Filters are useful for selectively filtering undesirable components of gas or smoke.

In an example, acetate flakes with acetylation degree 54.5% were dissolved in solvent of acetone and water (97:3) to a 25% soln., and dry spun to produce fibres of 4 d., while the atmos. 14 cm. under the nozzle was maintained at 3% of steam/air in vol. ratio. The fibres showed a void content of 22%, with void size of 0.07μ, and removal rates of 21% for HCn, 18% for NO, 25% for isoprene and 42% for nicotine. 20.6.77 as 073084. (5pp43)

Softening and oiling agent for leather - contg. liq. polymer obtd. by polymerising 6-18 C alpha-olefin
LION FAT & OIL KK 16.06.77-JA-071383
A17 (A97) (23.01.79) C14c-09/02

Softening agent for leather contains a liq. polymer of mol. wt. ca. 300-2000 obtd. by polymerising 6-18C α-olefin as the major ingredient.

Liq. polymer is not only more stable than natural oil and fat, but also shows less change with temp. than mineral oil. As the softening and oiling agent it is equal to conventional softening and oiling agent in giving good touch, tensile strength, tearing strength, weathering resistance, etc. to leather. Further it is free of unpleasant odours and hardly changes colour. 16.6.77 as 071383.

DAIL ★ D18 16922B/09 ★J5 4008-800
Tobacco smoke filter - prepd. by moulding mixt. of acetone-soluble cellulose di:acetate binder and refined copper fibre
DAICEL KK 17.06.77-JA-071624
A88 P15 (A11) (23.01.79) A24b-15/02 A24d-01/06

The filter is prepd. by adding a binder of acetone-soluble cellulose-diacetate to refined cotton fibre which contains $<2^{w}/_{w}\%$ of components soluble in aq. alkali soln. having alkali concn. 7.14% and has copper value <0.1, and moulding the mixt.

The filter can remove nicotine and tar without deteriorating the taste and flavour of tobacco smoke and can be prepd. at low cost.

The refined cotton fibre can be obtd. by steam-boiling linter with alkali to remove impurities and bleaching it with chlorine, hydrogen peroxide, etc. By the treatment the copper value and the content of alkali soluble components can be decreased to the stated values. 17.6.77 as 071624. (5pp5)

ANON ★ D18 17319B/09 ★RD -178-020
Appts. for continuous cigarette filter tip mfr. - uses tow of raw material which is loosened up, softened, shaped, sheathed, and feedback-control monitored for density
ANONYMOUS 20.01.79-RD-178020
*F04 (10.02.79) B01d-00/**

A continuous tow of raw material is led through two spaced air nozzles to loosen up the material and then passes through to spray device where a softening agent is introduced. Movement of the material is maintained via a series of spaced pairs of idler and driven rollers. The strip-like tow of material passes through a shaping funnel and a glued continous length of sheathing material wrapped around it by means of an accompanying endless shaping band.

The assembly then passes through a seam smoothing and drying off device before cutting into individual filter tips. A beta-ray monitor in front of the knife controls the density of the prod. to predetermined limits, via signals fed back to the loosening up, softening, and shaping sections (926)

Leather ironing and embossing machine - using thin hollow cylinder heated by radiation with inner backup roll against pressure roll NL021176)
BADISCHE MASCHINENF 30.05.75-DT-524018
*(14.03.78) *DT2524-018 C14b-01/54*

An ironing and embossing machine for leather etc. has a thin-walled hollow cylinder which isheated by radiation from the outside and/or the inside. The ironing or embossing pressure is exerted by a back-up roll inside the hollow cylinder which presses through it against the leather, carried by a conveyor belt around a pressure roll.

This provides a very rapid way of adjusting the temp. to the desired value because of the small inertia of the thin hollow cylinder which need not exert the ironing or embossing pressure. The machine has a simple design and the hollow cylinder can be quickly exchanged for another with plane or embossed surfaces.

Hides salting container - has shelves with side troughs connected to brine discharge tube of collector

KAZA AGRIC ELEC MEC 26.03.76-SU-340284

Q37 (09.03.78) B65j-01/02 C14b-01

Improved working conditions when salting hides are due to the discharge of brine from shelves, ensured by a trough on the side of each cantilevered shelf. The trough is fastened between the vertical brackets of the frame with a connection to vertical tube draining the brine and which is fitted between the decks of shelves.

The container comprises fixing inserts between the ends of cantilevered shelves, and each brine discharge is inclined towards the discharge tube. The container is rolled below the salt feeder with the shelves set at an angle to the horizontal. Skins are placed on the shelves of the first deck and salt is fed for spreading on the upward flesh, and then another skin is placed in a similar position for salting.

In the next step, the shelves of the second deck are fitted in with separating inserts between the shelves followed by skin. placement and salting. The filled container is rolled out for curing with brine drained into a collector. Sentbekov, L., Nepsha, G.E., Kipshakbaev, I. et al. Bul 14/15.4.78. 26.3.76. as 340284 (3pp89)

Compressed gas propellant aerosol spray - for cosmetics, pharmaceuticals, detergents, etc., has controlling orifices to give the desired proportion of gas and liq.
SPITZER J G 06.01.77-US-757414 (19.07.76-US-706857)
A97 B07 G04 Q34 (13.02.79) B65d-83/14

An aerosol can comprises a body contg. an aerosol liq. and a space above the liq. contg. a propellant gas given off by a propellant liquid mixed with the aerosol liquid. A valve housing contg. a poppet biased by a spring against a sealing gasket is carried in the upper part of the body.

The poppet carries a hollow extrusion secured to a press button having a dispersing orifice and having an aperture normally located within the confines of an aperture in the sealing gasket. A capillary tube dips from the valve housing into the aerosol liq. and a gas aperture is provided in the housing.

The spring normally biases the poppet upwardly to a position in which the aperture in the extrusion lies within the sealing gasket and thus dispersing is prevented when the button is depressed the poppet is pushed downwardly against the spring and the aperture in the extension moves into the valve housing to allow dispersing of the foamed mixture within the housing. The foamed mixture is formed by the gas entering the housing through the gas aperture mixing with liq. from the capillary tube.

By specific sizing of the various apertures the amt. of gas used to form the foam, and thus the amt. of liquid to form the gas, is reduced over the prior art. 30.6.77 as 281798 (42pp525)

M26 P32 (25.01.79) A61c-05 C22c-19/05

The alloy comprises Cr 9-25%; Cu 7-20%; Mn 15-28%; Nb 2-7%; Si 0.5-3% and the remainder Ni and incidental impurities.

For example, an alloy of Ni 41.5%; Cr 15%; Cu 15%; Mn 20%; Nb 5%; Si 1% and impurity 2.5% was fused and centrifugally cast.

The tensile strength, Vicker's hardness and elongation of the cast alloy were 44.5 kg./mm^2, 200 and 2.5%, resp. The alloy had favourable castability, small shrinkage during the solidification and less mould sticking property, and was not discoloured in oral conditions. 24.6.77 as 076014. (2pp8)

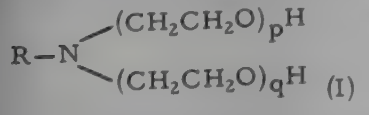
Aerosol foams esp. for shaving - stabilised with nitrogen-contg. surfactant and fatty alcohol

THOMPSON J (WILK) 27.02.75-GB-008249

*A97 E16 (A25 E13) (20.02.79) *GB1479-706 C11d-17*

Aerosol shaving foam dispenser contains an aq. soap-free surfactant conc. contg. an emulsified/readily emulsifiable gaseous aerosol propellant in liq. phase.

The conc. comprises mainly water and 1-15wt.% N-contg. surfactant and 0.5-6wt.% conc. of water-insol. 12-18C fatty alcohol, to yield HLB value of 8-18 in ratio surfactant to fatty alcohol 0.5-12:1. N-Contg. surfactants include cpds. of formula (I), where R is 12-18C straight chain alkyl and p and q are 1-30 totalling 10-30. Other specified N-contg. surfactants have amine oxide or imidazole ring gps.



$$R-N\begin{cases}(CH_2CH_2O)_pH\\(CH_2CH_2O)_qH\end{cases} \quad (I)$$

The aerosol foam emulsion has good foaming properties, is scum-free and has good scum-dispersing properties with hard water. 27.2.76 as 662282. (5pp931)

ARMO ★ D21 17872B/09 ★US 4140-656

Anhydrous clear gel face cleanser - contg. mineral oil, phosphate ester(s), and high mol. wt. carboxy vinyl polymers

ARMOUR-DIAL INC 07.10.77-US-840209

A96 (A14 A25) (20.02.79) A01n-09 C11d-07/24 C11d-17

Facial cleanser compsn. consists of an anhydrous mixt. (as clear gel) of: (a) 97-49.5 pts. by wt. of mineral oil; (b) 3-50 pts. by wt. of one or more phosphate esters $RZ-(OCH_2CH_2)_x-OP(O)(OH)-OM$ (I) or $[RZ-(OCH_2CH_2)_x-O]_2-P(O)-OM$ (II); and (c) 0.1-5 pts. by wt. of a high mol. wt. carboxy vinyl polymer (III) consisting of acrylic acid crosslinked with a polymer of a copolymerised polyalkenyl polyether. (I) and (II) have solubility in the mineral oil of ≥7% by wt., (where M is a univalent metal cation; R is 9-21C opt. branched hydrocarbyl (0-3 double bonds); Z is CH_2, CO, C_6H_4, NH, $N(R^{11})$, SO_2, CONH, or SO_2NH; x is a no. 1-10 (on average) to keep solubility requirement-depends on R).

Addn. of (I) or (II) to a mixt. of mineral oil and (III) gives an anhydrous clear gel which is minimally irritating to human tissue, has greater rinsability than mineral oil gelled by other methods, is self-emulsifying, and has cleansing efficacy equal to pure mineral oil. 7.10.77 as 840209. (5pp478)

HUBE ★ D21 17911B/09 ★US 4140-757

Silica thickeners for dentifrice compsns. - to reduce costs and improve properties by partially replacing gum thickeners

HUBER J M CORP 06.07.77-US-813323 (21.07.75-US-597621)

A96 B05 E33 (20.02.79) A61k-07/16

Dentifrice compsn. contains (all wt.%) 10-60% abrasive (I), 15-40% humectant (II), 0.4-0.9% gum thickener (III), 1-20% SiO_2 thickener (IV), and 35-50% H_2O.

(II) is pref. glycerol, but may also include other humectants such as sorbitol. (I) include silica abrasives, Ca phosphates, silica xerogels etc. Pref. amt. of (III) is > 0.5-0.8wt.%. (IV) are pref. prepd. as in US 3967563, and have prim. particle size <40 mμ, void vol. 3-6 cc.Hg./g., oil absorption 150-250 pref. >200 cc. oil/g, surface area 100-400 pref. > 250 m^2/g., and wet cake moisture 85% ('Zeo', 'Zeodent', 'Zeosyl', Zeofree', and 'Zeothix' (all RTM)). (IV) is added with (I) towards the end of the mixing procedure of the toothpaste.

Replacement of up to 50% pref. 20-50wt.% of a conventional (III) in a toothpaste compsn. by (IV) reduces costs, improves the cosmetic, lustre and brightening and deaeration properties of the paste, slightly lowers the overall abrasion characteristics, and allows the thickener to be handled easily and to remain effective under all humidity conditions. 6.7.77 as 813323. (5pp478)

Shrink wrapped stick of concertina folded tubular sausage casing - facilitates, storage, handling, soaking and filling the casing
UNION CARBIDE CORP 25.08.77-US-827421
Q32 (26.02.79) A22c B65d

A stick of concertina-folded and axially compressed tubular casing, for filling with food prod. such as sausage meta, has a longitudinal passage extending axially right through the stick, and is tightly wrapped in a sleeve of heat-shrunk film.

One end of the wrapping sleeve is folded inwards and tucked inside the entry to the passage through the stick. This end of the stick can later be threaded on to a mandrel of a filling machine. The other end of the wrapping sleeve extends beyond the corresp. end of the stick and forms a tube from which the casing can be axially unfolded for filling. The heat-shrinkable film is pref. perforated.

The hot-shrinking operation is pref. carried out with the stick threaded on to the minor dia. rod of a stepped dia mandrel. The end of the wrapping sleeve to be left open is shrunk temp. on to the major dia. shank of the mandrel.

The wrapping film maintains the folded formation of the casing and protects the casing from contamination. The film controls the longitudinal expansion of the stick during soaking and holds the casing together for convenient loading on a filling machine. 24.8.78 as 869953 (17pp448)

Fractionation of fatty materials - by crystallising dispersion in aqueous solution of surfactant-electrolyte
HENKEL KG AUF AKTIEN 07.04.73-DT-317563
*J01 (22.02.79) *BE-813-285 C11b-07 C11c-01/08*

A method of sepg. a mixt. of fatty materials into its constituents which have differing m.pts. utilises the wetting technique. After melting, the mixture is cooled to the point at which the constituents with the higher m.pts. crystallise; the necessary heat absorption being effected by vapourising under vacuum, an aq. phase in direct contact with the mixt.. A dispersion of the separate fluid and solid particles is centrifuged, and the hither m.pt. fatty materials are sepd. from the aq. phase by filtration.

Thehigh investment and operating costs for refrigeration plant, cooling scrubbers, etc. are eliminated by adding an aq. soln. of an electrolyte which is not surface active, to the molten mixt. and vaporising part of the water of the electrolyte by vacuum whilst the mixt. is intensively agitated, until partial or complete crystallisation of the components melting at higher temps. takes place.

Whilst dispersion of the fluid and solid matter is being carried out a soln. of a wetting agent is added; vacuum extn. and vaporising of the water being continued until the sepg. temp. is reached in this stage. 7.4.73 as 317563 (6pp1045).

Leaf essential oil content determination - by evaporating in hot airstream and passing through standard calibrated flame ionisation detector

KOKSHAROV A S 07.03.73-SU-891994

R16 (05.06.78) G01n-33

The essential oil content of vegetable material is determined more rapidly by evaporating-off the oil at an air temp. of 140-170°C, passing the vapour through a flame-ionisation detector and constructing a graph. The area of the peaks is measured and the oil content determined from a relationship between peak area for test and standard samples, with allowance for the moisture content of a test sample.

A sample, e.g. of 55-100 mg. mint leaf, is evapd. in an air flow at 140-170°C and the flow is passed through a detector connected to an amplifier and recorder. After obtg. a symmetrical peak the sample is re-weighed in order to calculate moisture content. A known amount of the oil, e.g., 1-3μl, then applied to paper strip and a standard peak is recorded. Calibration is carried out after every 15-20 tests.

Di:methyl-octanol or its mixt. with acetate used in perfumery - is prepd. by condensing isobutyraldehyde with methyl-isobutyl-ketone, and hydrogenating and hydrating prod.

SCENTED SYNTH NATUR 22.01.76-SU-318311

E17 (30.05.78) C07c-31/02 C07c-67/04

Technologically simpler prepn. of 2,7-dimethyloctan-2-ol (I) or its mixt. with acetate in improved yield is based on condensing isobutraldehyde (II) and methylisobutylketone (III) in aq. alkali at 60-90°C. The formed ketone is hydrogenated in presence of Raney Ni at 160-170°C under 100-110 atmos. The formed sec. unsatd. alcohol is dehydrated in presence of catalyst (H_3PO_4 or silicagel) at 340-350°C. The formed olefin mixt. is hydrated in aq. isopropanol in presence of catalyst (cationexchange resin) or reacted with aq. acetic acid in presence of catalyst (e.g. H_2SO_4).

The prod. is used in perfumery.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

GRAN- ★ D11 18061B/10 ★BE -871-553
Small oven for browning pre-baked loaves etc. on rollers - which are mounted in withdrawable chassis for easy servicing
GRANDS MOULINS PARI 27.10.77-FR-032479
(15.02.79) A21b

The oven is of the type has a heated cooking chamber in which the prod. is continually turned on rotating, parallel, supporting rollers. The rollers are now mounted alongside each other in a chassis which can be removed like a sliding drawer through one wall of the oven. Drive transmission to the rollers is pref. disc-connected mechanically as withdrawal of the chassis commences, so there is no possibility of the rollers being rotated as they become accessible.

Mechanical disconnection of drive transmission is pref. by axial withdrawal of roller shaft extensions drom driving engagement with the bores of driven gears. A heat reflective tray fitted under the rollers can be pulled out of the chassis, drawer-fashion.

The appts. is easy to service and clean. 26. 10. 78 as 871553 (13pp448)

STEI- ★ D11 18092B/10 ★CA 1048-848
White bread with increased fibre content - obtd. by incorporating yellow field pea hull fibres with flour
STEINBERG INC 28.12.76-US-755021
(20.02.79) A21d-08/02

High fibre content white bread is prepd. using a compsn. comprising 100 pts. wt. flour and 5-20 pts. wt. yellow field pea hull fibres of particle size 0. 25-2 mm. A dry mix for making the bread pref. also contains 1-10 pts. wt. sugar, and sufficient leavening.

The fibres are biologically active and do not spoil the appearance of the bread. 14. 12. 77 as 293080 (11pp955)

LIPP/ ★ D11 18290B/10 ★DT 2738-778
Dough kneading machine - with eccentric kneading bell in segmented kneading trough for diameter and inclination adjustment
LIPPELT W 27.08.77-DT-738778
(01.03.79) A21c-07/04

A circular dough kneading machine consists of a circular kneading trough and a revolving kneading bell inside it with a drive shaft moving along a circle concentric to the trough axis. The trough is subdivided into segments which can be moved to adjust the inside trough diameter. The side walls of the trough can also be varied in their inclination.

This machine can be adapted to dough of varying consistency and to lumps of dough of different sizes. It allows a greater range of special bread types to be kneaded. 27.8.77 as 738778 (13 pp39).

NISS D11 50334Y/28 #GB 1541-504
Preventing cave-in of baked goods - by applying mechanical shock immediately after baking
NISSHIN FLOUR MILL KK 27.01.76-US-652887 (27.01.76-GB-003095)
*(07.03.79) *US4034-119 +A21b-03*

Baked articles (e.g. bread and cakes) are prevented from collapsing by applying a mechanical shock to the article a sufficient size to be transmitted to the article centre at a temp. ≮5°C below the baking temp. The shock is equivalent to dropping the baking tin 3cm.

The shock is pref. applied using vibrations, letting it fall onto a rigid surface, letting it slide down a slope onto a rigid surface, passing it over an uneven path, or striking it laterally or from underneath. 27. 1. 76 as 003095 (11pp1376)

SPEC- D11 83190Y/47 =GB 1541-797
Alimentary paste and pastry prepn. using soya - as flour or granules, treated to remove bitterness and inactivate trypsin (NL 16.11.77)
SPECIAL FOODS CORP 14.05.76-DT-621545
*(07.03.79) *DT2621-545 A21d-02/36 A23l-01/16*

Pasta comprises an unleavened mixt. of cereal, eggs, water and soya prepd. using a debittered soya prod. in the form of flour and/or grits. Soya prod. is subjected to a treatment for deactivation or removal of trypsin inhibitor.

Pref. pasta contains additional soya protein extract. Soya is pref. free of oil, and present in an amt. of 5-65 wt. % pasta (esp. 10-25 wt. %) in a fresh condition. Amt. of soya, including soya protein extract, is such that the total amt. of protein is 25wt. % w. r. t. pasta (esp. 40 wt. %). Additional wheat bran or pulses are pref. added as bulking agent. Soya prod. is pref. grit with particle size 0. 3-1mm

Prod. has improved flavour characteristics with better consistency in doughs using soya flour. 11. 5. 77 as 019813 (2pp931)

KANE ★ D11 19342B/10 ★J5 4014-373
Water soluble granular moulding e.g. biscuit prodn. - from powdered food, using moulding plates mounted on endless moving belt
KANEBO KK 04.07.77-JA-080127
P71 (02.02.79) A21c-11/02 B01j-02/22 B30b-11/14

Moulding plates, each having moulding holes are demountably disposed on a capterpillar conveyor, above which are disposed means for feeding the moulding plate onto the conveyor, powder feed hopper, press roller, and means for taking out the moulding plate along the running way of the conveyor. The powder is charged in the holes of each moulding plate and the conveyor from the hopper, pressed by the roller, heated for a while, and taken out from the conveyor.

The process is simple and provides biscuits etc. in high yield. 4.7.77. as 080127 (4pp26)

UFOO= ★ D11 19634B/10 ★SU -603-360
Raw dough emulsion coating machine - comprises emulsion tank, coating brush and feeder mounted on a reciprocating carriage, to improve coating uniformity
UKR FOOD MECH ENG 01.09.76-SU-397999
(15.04.78) A21c-09/04

Raw dough emulsion coating machine has the emulsion tank, coating brush and feed mechanism mounted on a reciprocating carriage for reduced material usage and more uniform coating.

The machine is used in the baking industry and comprises chaintransporter with carriage on guides. A platform is mounted on a rod attached to the carriage and tank with drum chute with perforated base the feeding coating brush. Float vale 10 controls tank 7 level from reservoir 12 by line 11.

Zolotov, E.B., Markushenko, N.I., Tkachenko, I.P. et al. Bul. 5/25.4.78. 1.9.76. as 397999 (2pp129)

ZIEM/ ★ D11 19974B/10 ★US 4141-998
Powdered sour:dough bread flavouring compsn. - comprising acetic acid adsorbed on carbohydrate carrier with glyceride stabiliser
ZIEMKE W H 12.05.77-US-796146 (31.12.75-US-645537)
A97 (27.02.79) A21d-02/08

Ingredient for sourdough bakery prods. is a flowable powder comprising 2-15 wt. % acetic acid and opt. 1-8 wt. % of fumaric, tartaric and/or citric acids absorbed onto a finely-divided solid edible absorbent (A).

(A) is a starchy polysaccharide or an edible cellulosic material, and the compsn. is stabilised against loss of acid(s) by blending with a small amt. of normally solid, edible fatty glyceride (B). (B) holds the acid(s) in (A) and reduces their evapn. during baking. (A) is pref. (pre)gelatinised wheat, starch, edible wood-flour, carboxymethylcellulose or methylcellulose.

Compsns. are easily handled, stored and transported without loss of flavour. They can also be used to improve the flavour of white bread, biscuits, pancakes, etc. The parent patent uses acetic acid and lactic acid. 12.5.77 as 796146 C.i.p. 4034215 (6pp1251).

D12: MEAT; FISH PROCESSING

CROM- ★ D12 18019B/10 ★BE-870-134
Hand tool to open bivalve shellfish esp. oysters - has self aligning blade to obviate shell splinters in edible prod.
CROMBACH INVESTMENT 01.09.78-BE-870134
P27 (01.03.79) A22c A47g

The tool has a baseplate with a support for the hinged end of the shell while a blade is forced between the shell halves at the other end, progressing towards the hinge until the shell is opened. The blade is pivoted about an axis perpendicular to the longitudinal axis, i.e. the axis of travel, of the blade. The pivotal axis pref. takes the form of a stub shaft with a bearing in the blade. The stub shaft is pref. linked to a hand lever which can be actuated to force the shaft towards the support on the base.

Used for opening mussels, oysters, clams, etc. The leading edge of the blade is self-aligning to suit random shapes and sizes of shell. 1.9.78 as 870134 (7pp448)

HAVE- D12 19307W/12 =DS 2450-277
Animal stunning tongs - for use in slaughter house providing mechanical and electrical shocks
HAVERHILL MEAT PROD 23.10.73-GB-049348
*+P14 R59 (01.03.79) *BE-821-271 A22b-03/06*

A pair of tongs for stunning animals in an abattoir, has an electrical switching circuit timed to work with the operating mechanism which pulls the electrode heads on extending arms towards each other, so that first of all power is laid on to the electrodes. As the electrode heads touch th the head of the animal, an electronic impulse of predetermined waveform, frequency and tension is produced during a predetermined interval of time, between the electrode heads.

The tongs work in the most humane manner possible, and in partic. prevents the convulsive flexing of the muscles by a frightened animal which hinders bleeding and makes the flesh tough. 23.10.74 as 450277. (8pp1045)

REKA/ ★ D12 18288B/10 ★DT 2738-731
Fish smoking chamber - with hearth above tubular water coil embedded in fireclay for heat recovery
REKATZKY H 27.08.77-DT-738731
(01.03.79) A23b-04/04

Fish smoking chamber has underneath the hearth for the wood fire, which consists of fire-bricks, a layer of fireclay in which a coil of water-carrying tubes is embedded. This coil is part of a hot water or space heating circuit. The fireclay layer rests on an aluminium foil and a glass fibre mat which cover the concrete foundation.

This recovers the heat from the wood fires used for fish smoking which otherwise is wasted. Experience shows that the busy season for fish smoking coincides with the cold season when most heat is required. 7.8.77 as 738731 (8pp39).

HENN/ D12 42692Y/24 =GB 1541-589
Manual measuring instrument esp. for animal carcase fat layers - which has probe detecting and indicating change of conditions
HENNESSY J B 01.12.75-NZ-179410
*R11 +R16 (07.03.79) *NL7613-374 G01b-05/06 G01n-21/48*

A depth measuring device includes a light source and a light sensitive element engaged with a lance. The element receives reflected light from the environment surrounding the lance. A distance measurer measures the distance between a reference point and a position of change in the light reflected to the element. The change in the light received is indicated by an indicator.

Pref. the lance is a spike extending from the body of the measurer. Used for measuring fat thickness an animals. 23.11.76 as 048770 (6pp1376)

STRK D12 63419X/34 =GB 1541-720
Bird locating system - for positioning a bird prior to making an incision in the rectal zone for subsequent removal of intestines etc

Pyrogen-free collagen prodn. - by treatment with hypochlorite, washing with ethanol soln., then with water
AVICON INC 29.08.77-US-828350
(D18 D22) (07.03.79) C07g-07

Pyrogen-free collagen is prepd. by mechanically removing foreign substances from the surfaces of collagen while it is in contact with an aqs. soln. of an alkali(ne earth)metal hypochlorite, washing the collagen in aqs. ethanol soln. and then in pyrogen-free water.

The treatment soln. pref. contains 50-250 ppm NaOCl, and has pH 7-8. Scraping is pref. carried out by drawing the corium through rotating brushes under a stream of hypochlorite soln. Excess soln. is removed, by pressing or centrifugation, and the material is immersed in a soln. contg. 30-70% EtOH, pref. 70 vols. EtOH and 30 vols water with agitation, for 15-30 mins. This step is pref. carried out 3 times. After washing in pyrogen free water, the prod. is then ready for use. 7.8.78 as 032436 (5pp955)

TOYM ★ D12 18815B/10 ★J5 4011-333
Continuous prodn. of soft, elastic protein fibres - where extruded filaments are cut into fibres while being drawn, used for pressed ham prodn.
TOYOBO KK 20.06.77-JA-073473
(27.01.79) D01f-04

The slurry dispersion of the protein with $\geq 10\%$ solid matter is pressed while being heated. After the heated slurry dispersion is fed to the spinning head, it is extruded into the filaments from the spinning orifices. At the same time, compressed air is injected to the extruded filaments from the nozzles made around the group of the spinning orifices so that the filaments are cut into fibres while being subjected to drawing. Pref. the spinning temp. of the slurry dispersion is 120-160°C and the heating time is <10 seconds.

The protein fibres are used in the prodn. of pressed ham. 20.6.77. as 073473 (4pp142)

SNOW ★ D12 18816B/10 ★J5 4011-334
Fibrous edible protein prodn. - by extruding alkaline protein soln. obtd. from e.g. soybeans into a bath contg. acid and salt and neutralising
SNOW BRAND MILK PRODUCTS 29.06.77-JA-076488
(27.01.79) D01f-04

A protein soln. prepd. by dissolving protein sepd. from natural raw material (e.g., soyabean, etc.) in aqueous alkali soln. is extruded through a nozzle into coagulating bath containing acid and salt. The resulting fibrous protein is then neutralised in aq. solution of organic acid and/or organic acid salt adjusted to pH 4.0-11.0 to obtain fibrous protein of which pH is 4.0-7.0.

The process is used for producing edible fibre which can be used as substitute for natural meat. The process permits neutralisation of the protein fibre at pH 4.5-5.0 (i.e., near the isoelectric point) to minimise protein loss during the neutralising process. 29.6.77. as 076488 (4pp173)

Fish filleting machine - with two pairs of parallel rotary cutters and divergent ploughshares pulling off fillets
UNILEVER NV 14.05.74-GB-021221 (11.11.75-SU-189603)
*(20.03.78) *DT2521-272 A22c-25/16*

Fish filleting machine output is improved by providing slotted side filleting cutters permitting passage of ribs and fine bones. The side cutters may be adjustable. The skin separator has steam jets. The machine is used in whole white fish preparation by filleting, e.g. of cod, haddock, pollack.

Fish is held on a holder and transporter by forward pointing shoulders head being forward towards cutters for side filleting. There are also spring loaded guides and side fillet removers, which are slotted for through passage of ribs and fine bones, and are diverging. Double cutter takes a V-shaped cut from between the ribs and fine bones. Steam jets are used to break the fine bones from the skin, thus facilitating fine bone removal.

The fish moves along the line at 0.5m/s, or 38 holders/min. The cutters are 200mm dia,. and rotate at 850r.p.m. The side fillets are of good quality and bone free. The V-sections taken by the cutters are further processed to remove bones by breaking.

Pig carcass cleaning machine - has independently moving sections of scrapers, for improved groin area cleaning
MINSK MEAT DAIRY 03.06.76-SU-367387
(15.04.78) A22b-05/08

Pig carcass cleaning machine has a drum with separate sections, independently moving across the carcass for improved cleaning of groin areas. The machine has conveyors, transporters, scrapers and other mechanisms, the groin area scraper comprising a shaft mounted on bearings in a frame and having sprocket, chain connecting with sprocket on a shaft. A shaft with cross member, has pin and connecting rod connecting to pin of a crank. A shaft connects to crossmember and carries the ground cleaning drum comprising sections formed by two side cheeks pivoting on a shaft and with axial freedom of movement along it, and relative to each other. Between the cheeks is a spacer and pivot carrying a sprocket with scraper.

The side cheeks have chain tensioners retained by bolts One side cheek of each scraper section has a pin on which an arm is attached. In operation the groin cleaning scrapers operate by upward movement of the scrapers with simultaneous reciprocation along the carcass.
Litovko, V.I., Petrovich, V.A., Khalotskii, G.N. et al. Bul. 15/25.4.78. 3.6.76. as 367387 (6pp129)

Injecting fluids into meat prods. using fluid manifolds - having injectors needles and stripper plate to sense thickness of meat for fluid delivery from pump

TOWNSEND ENG CO 20.04.77-US-789017

(27.02.79) A23l-01/31

Machine for injecting fluids into meat products comprises a fluid manifold movable toward and away from an underlying support for a meat product and having injecting needles for piercing the meat. A pump and the manifold are operatively connected to supply fluid to the meat product at a rate proportional to the velocity of the needles w.r.t. the product. The supply is effected in response to the sensing of the meat product by a plate which moves with the fluid manifold towards the product.

Used for injection of pickle or curing solns. for subsequent curing, e.g. for bellies and other products. The amt. of fluid delivered through the needles is varied in proportion to the varying velocity of the needles as they move into and out of the meat product. The displacement pumps are driven from the same crank which drives the fluid manifold. A stripper plate senses the meat product surface and controls displacement of the pump in accordance with the thickness of the product. The provision of a cam in the drive mechanism makes it possible to provide fluid through the needles both during penetration and withdrawal strokes. 20.4.77 as 789017 (11pp1044).

In a method to concentrate fluids like fruit juices or coffee extract, a combination of boiling down in a steam heated multi-stage evaporator with the recovery of volatile flavours and aromas by stripping is used, followed by distn. using direct steam. The steam required for the recovery of the volatile aroma ingredients is entirely obtd. from the steam produced in the evaporator.

The integration of the aroma recovery and boiling down processes results in considerable savings in energy consumption. 12.8.78 as 835519 (16pp39).

The culture medium for cultivation of the enzyme is pref. liq., and submerged fermentation is pref. adopted for recovery of the enzyme. The culture medium contains starch, dextrin or sugar, such as sucrose, as carbon source, and ammonium salt, corn steep liquor, pepton, meat extract, soy bean powder and/or yeast extract as nitrogen source. Salts of calcium, zinc, potassium, sodium and magnesium may be added.

The culture is at 25°C for 10 hr. The enzyme is recovered by pptn. with addn. of alcohol or ammonium sulphate and adsorption with e.g. cellulose, etc. 0.25-0.5 wt.% of the enzyme on the juice is added and maintained at 45°C and pH 3.5-4 under agitation of 500-1000 rpm. 25.6.77. as 074940 (3pp42)

HANA/ ★ D13 19004B/10 ★J5 4012-103
Gel forming process - by adding hydroxy-carboxylic acid and opt. alkali metal oxyhydrogen salt to soln. of alkali metal silicate
HANANO T 29.06.77-JA-078217
B06 C05 E34 P53 Q42 (29.01.79) A01n-07/02 B22c-01/16 C02c-03 E02d-03/14

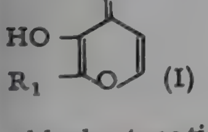
Aq. soln. of alkali metal silicate, e.g. sodium silicate etc. is geleted very rapidly at a pH of 6 to 9 by adding oxycarboxylic acid, e.g. malic acid, gluconic acid, tartaric acid and citric acid etc. or a mixt. comprising the oxycarboxylic acid and an alkali metal oxyhydrogen salt, e.g. $NaHSO_3$, NaH_2PO_4, $NaHSO_4$ and $KHSO_4$, etc.

The oxycarboxylic acid is used as food additive and pharmaceutical intermediates etc. and has low toxicity for humans; process is suitable for use in engineering work, e.g. strengthening of weak ground or stepping of water-leakage of the ground etc. Gel forming process is also applicable for the solidification of casting sand, the solidification of sludge and for granularisation of fertiliser etc.

The gel formed is translucent and exhibits excellent water-holdability without having bloom on its surface even in allowing to stand in the open air; it is suitable for use in preventing hanging-down or penetration of inorganic paint, aq. paint and aq. ink etc. as well as for use as the improving agent or as the filler for water-soluble resins, e.g. amino resins, acrylic resins, cellulose resins, PVA resins etc. The gel is further used as moisture-absorbing agent, catalyst carrier and as gas-adsorber etc. in dewatered dried state etc. 29.6.77. as 078217 (4pp34)

KIYO- ★ D13 19048B/10 ★J5 4012-377
3-Hydroxy-2-alkyl-4H-pyran-4-one(s) prepn. - by condensing 3,4-epoxy-2-alkanone(s) with alkyl formate and oxidising the prod., useful as food flavour improvers
KIYOMI KAGAKU KK 30.06.77-JA-078396
E13 (30.01.79) C07d-309/40

3-Hydroxy-2-alkyl-4H-pyran-4-one (maltols) (I) is prepd. by condensing 3,4-epoxy-2-alkanone (II) with alkyl formate over a base in ethereal solvent and oxidising the resulting product with a gas contg. oxygen. In (I) R_1= lower alkyl.



(I)

(I) is useful as food flavour improving agent and can be prepd. industrially and economically by simpler steps without adopting troublesome longer steps of known methods. (II) is available by treating 3-penten-2-one with m-chlorobenzoic peracid in methylene chloride. Base includes alkanolate and alkali hydride. Ethereal solvent includes lower alkyl ethers (diethyl ether) and cyclic ethers (TFH). 30.6.77. as 078396 (3pp104)

HORI- ★ D13 19060B/10 ★J5 4012-400
Stevioside prepn. from Stevia rebaudiana - by extracting with (hot) water or aq. alcohol, addn. of iron flocculant, then adjusting pH to ppte. impurities
HORIUCHI ITARO KK 29.06.77-JA-076633
E13 (30.01.79) A23l-01/22 C07g-03

Stevioside (I) is sepd. and purified by treating leaves and stalks of Stevia rebaudiana with water, hot water or hydrous alcohol; adding iron cpd. to the extract; adjusting pH of the extract to specifically coagulate the ppte between the iron cpd. and the foreign materials contained therein and removing the ppte.

Stevioside is a diterpene glycoside having good sweetness. The present process provides a low cost commercial purificn. which does not reduce yield .

The iron cpd. may be ferric sulphate, ferric chloride, and ferrous sulphate. pH value is adjusted to 4-11, pref. 7 with alkali (sodium hydroxide, ammonia).

Raw leaves of Stevia rebaudiana (50g) was extd. with water(1.6 L)at 85-95°C to give an extract (1.52 L), which was mixed with ferric sulphate hydrate (9.5 g). Soln. was adjusted to pH 7 with N-sodium hydroxide and stirred gradually for 10 min. Coagulated ppte was filtered off. Filtrate was treated with a mixt. of strong acidic cation exchange resin (Amberlite IR-120B RTM) (200 ml) and strong basic anion exchange resin (Amberlite IR A-410 RTM) (400 ml) and conc. in vacuum to give stevioside (6.2 g) as white powder. This was crystallised from methanol to give colourless needles. 29.6.77. as 076633 (4pp104)

Agglomerated soluble coffee particles are produced by contacting a falling stream of falling particles with a stream of wetting agent, which makes an angle of 45-135° with the direction of motion of the falling stream.

The coffee particle stream is formed from coffee flakes of 0.05-0.25 mm thickness and 0.8-1.7 g/cm^3 density, or a mixt. of 5-80 wt.% of such flakes and 20-95 wt% dense coffee powder of bulk wt. 0.3-1.0 g/cm^3 and particle size 5-500 µm. The coffee particle stream at the point of contact with the wetting agent stream has a thickness of $>$1.6 mm.

Specifically the coffee flakes are of thickness 75-178 µm , and of size $>$0.59 and $<$2 mm; the dense coffee powder is of 10-100 µm size. The wetting agent impinges at 600-3050 m/min at right angles onto the coffee particle stream in the form of a column of dia. 6-26 mm. 31.3.69. as 004994 (8pp913)

Anadromous fish are reared in captivity on a diet contg. as food additive comprises (a) an acyl lactylate consisting of cpds. of formula RCO.O.CH(CH_3)CO.O.CH(CH_3)COOH (where RCO is a 12-20(16-20)C acyl gp. and X is H or a metal atom) and (b) a carotenoid pigment which is canthax- anthin and/or astaxantin. The wt. ratio (a):(b) is 10-1:1-5. The additive imparts pigmentation to the flesh of the fish.

Pref. the acyl lactylate is stearoyl lactylate, esp. sodium or calcium stearoyl lactylate. Pref. the additive also contain a carrier or diluent which is an edible gum, and/or sugar (deriv.). 21.3.77 as 779785 (3pp918)

QUAK ★ D13 19973B/10 ★US 4141-996

Modified liq. vegetable protein prod. - made by fermenting, reacting with hydroxide and peroxide, then evapn., with better colour, odour and taste

QUAKER OATS CO 13.05.76-US-685733
(27.02.79) A23j-03

A liq. phase protein prod. is made by fermenting an aq. slurry, with 3-20 wt.% solids content, of carbohydrate-contg. plant protein material of >30 wt.% protein. The slurry is fermented with 0.1-5 wt.% Saccharomyces cerevisiae or S. carlsbergensis at 33-90°F for 4-96 hr. to produce CO_2.

An alkali metal hydroxide or NH_4OH is then added to form a carbonate and adjust pH to 7-10.5. The slurry is heated to react the carbonate and protein, then pH adjusted to 6-8 with edible acid or alkali. The mixt. is then mixed with 0.3-2 wt.% peroxide per lb. protein and heated to b.pt. at 15-30 in. vacuum to remove steam-volatile flavour components.

Treatment improves odour, colour and flavouring giving a bland, creamy-white prod. with similar thermoplastic and binding properties as casein and its salts. 13.5.76 as 685733 (5pp1251).

MILE D13 14203B/08 = US 4141-999

Simulated bacon product formed of fat and lean layers - with specified fat layer compsn. and opt. specified lean compsn.

MILES LABORATORIES INC 07.10.77-US-840123
*(D12) (27.02.79) *BE-871-090 +A23j-03*

Bacon-like meat analogue having expanded layers simulating the lean and fat portions of bacon is produced by cooking a compsn. mixt. contg. 10-40 wt.% vegetable protein fibre, 5-20 wt.% albumin, 5-20 wt.% starch, 30-60 wt.% water, 3-40 wt.% vegetable oil, 0.1-1.5 wt.% vegetable gum, 2-20 wt.% vegetable protein isolate, 0.05-0.5 wt.% dextrose, 0.005-0.05 wt.% food grade colouring, 5-20 wt.% flavours and seasonings contg. a dispersed gas.

Improvement comprises expanded layers simulating fat portions produced by cooking compsn. mixt. contg. 3-7 wt.% albumin, 25-40 wt.% water, 0-6 wt.% vegetable protein, 52-65 wt.% vegetable oil, 0.05-0.6 wt.% vegetable gums and 4-10 wt.% flavours and seasonings contg. dispersed gas.

Prod. has simulated fatty portion intended when fried to ripple or crinkle and have a juicy, fatty mouthfeel similar to natural bacon. 7.10.77 as 840123 (3pp931).

RUPE- ★ D13 19976B/10 ★US 4142-001

Contacting raw battered food prods. with carbon di:oxide snow - to set uncooked batter to non-flowing condition by temp. redn.

RUPERTS CERTI-FRESH 09.05.77-US-795118
(27.02.79) A21d-10/04 A23l-03/36

A coating of raw batter is applied to the outside of a food product and the latter is then placed on a layer of CO_2 snow while the batter remains uncooked. The coating rapidly sets to an essentially non-flowing condition through the temp. redn.

The food product may be precooled or prefrozen before application of the batter which is supplied in a pre-chilled condition. CO_2 snow may be sprayed onto the coated product while the latter is supported on the CO_2 snow layer.

Used for prodn. of frozen raw battered food prods., such as individual portions of fish. The prod. can be produced at low cost and eliminates the necessity for partial or complete cooking of the batter coating. Simpler and less expensive batters may be employed and the finished prod. does not suffer the effects of double cooking. 9.5.77 as 795118 (6pp1044).

GENO ★ D13 19977B/10 ★US 4142-002

Brewable mixt. of comminuted roast coffee and wheat - made from slowly roasted wheat, giving short drainage times

GENERAL FOODS CORP 17.05.78-US-906493
(27.02.79) A23f-01/02

Prodn. of a roasted and comminuted prod. contg. > 35 wt. % coffee and 35 wt. % wheat is improved when the raw wheat is roasted to an end temp. of 450-460°F over 40-90, esp. 50-90 min.

After roasting the wheat is comminuted and mixed with comminuted coffee, pref. having smaller particle size than the wheat. Esp. the wheat is roasted to a roast colour > 85, esp. 90-105, and the coffee is roasted to a colour of 40-60.

The prod. has acceptably short drainage time when used in the basket of drip coffee makers. 17.5.78 as 906493 (4pp1251).

AMHP D13 15979B/09 =US 4142-003
Edible, sprayable, lecithin vegetable oil compsn. - contains pure ethanol to reduce viscosity and give a single phase
AMERICAN HOME PROD CORP 22.08.77-US-826481
*(27.02.79) *BE-869-891 A23d-05 +A23j-07/02*

Edible compsn. comprises 3-12 wt. % of lecithin and 1-15 wt. % of 190-200° proof ethyl alcohol, the remainder being liq. vegetable oil, provided that when 190° proof alcohol is used the alcohol concn. is 1-8% in compsns. contg. the max. of 12% lecithin and 1-5% in compsns. contg. the min. of 3% lecithin. Compsn. may further contain a minor amt. of an antioxidant.

Compsn. is useful as a basting and anti-stick agent for application to foods or the pans, etc. The alcohol lowers the viscosity and provides a uniform one-phase system of high lecithin concn., suitable for dispensing from non-aerosol squeeze or spray bottles. 22.8.77 as 826481 (7pp927).

D14: FOODSTUFF MACHINERY

USHE/ ★ D14 18055B/10 ★BE -871-526
Machine to trim heads of carrots, etc. for canning - automatically orientates each carrot to be conveyed upright in single file
USHER T A 25.10.77-GB-044237
(15.02.79) A23n

A supply of randomly orientated carrots delivers them in single file, each carrot suspended vertically with its tail hanging between two, relatively moving, parallel bars. The file advances along the bars which transfer the carrots, maintained in the same arrangement, to hang between twin bands of a horizontal conveyor. The horizontal conveyor carries each carrot in turn under a steady roller which contacts the top of the head while the head is trimmed off by a cutter.

The parallel bars may be given a vibratory motion but are pref. a pair of cylindrical rollers rotating in opposite directions. The rollers are pref. inclined downwards towards the horizontal conveyor.

The machine mechanises a food industry task which has previously been labour intensive. 25.10.78 as 871526 (8pp448)

MIRO- ★ D14 18081B/10 ★BE -871-651
Machine for simultaneously grinding and mixing several substances - giving homogeneous mixtures or predetermined size distributions, used for mixing paints, foodstuffs, chemicals etc.
MIRODUR IT SPA 03.11.77-IT-051661
J02 P41 (15.02.79) B01f B02c

The machine consists of two or more discs turning in relation to each other, supported by an arm and arranged in such a way that their assembly may be plunged into a container holding the materials to be mixed, ground and homogenised. Each disc has on its surface facing another disc, having channels which are shaped and located in such a way that when one disc rotates the channels act as a pump.

As all the mixing and grinding operations are done in one vessel, loss of heat and materials during transfer from one vessel to another is avoided. 30.10.78 as 871651 (10pp1330)

Citrus fruit juice expeller - with movable scraper to keep filter surface clear of pulp
ZYLISS ZYSSET AG (ACKE-) 06.08.76-DT-635577
*P28 (01.03.79) *BE-857-473 A47j-19/02*

A squeezer for citrus fruits can be used to extract the juice from a large number of fruits before it is necessary to clean the sieve. It has a conical projection for pressing the fruit, beneath which there is a horizontal sieve and below the sieve a juice collecting tray. A wiper operated by hand is provided, and this brushes the residues of flesh etc. through the openings of the sieve as it turns around the pressing cone, into a collector close to the bottom of the sieve. 6.8.76 as 635577. (13pp1045)

SCHE/ ★ D14 18231B/10 ★DT 2738-05
Freeze dryer cooling chamber - with rotary discs forming meande path, with sieve portions, ensuring shorter travel for fine particles
SCHELAUSKE P J 24.08.77-DT-738058
Q76 (01.03.79) F26b-05/06

Freeze drying appts. for instant coffee has a cooling chamber for passage of powdered material. Inside the chamber is a stack of conveying surfaces onto which the material falls so as to follow a zig-zag path. The system is designed so that larger particles travel further than the particles.

At least one of the surfaces has perforations over par of its surface so that the fine particles fall through to follow a shorter path. These surfaces can be rotating discs so that the granules are carried outwards radially or tangentially. Gas or steam can be passed around the surfaces to give a sepg. or sifting effect. 24.8.77 as 748058 (14pp349).

FERR- ★ D14 18321B/10 ★DT 2834-98
Date stoning machine - with wipers and centring sleeves befor reciprocating stoning cutter station
FERRUM AG 18.08.77-CH-010128
(01.03.79) A23n-04/08

A stoning machine consists of an endless band of stoning plates with holes for the dates. Wipers and a centring device line up the dates in the holes before they reach the stoning station. Reciprocating ring cutters remove t stones from the fruit.

This prevents any wastage of fruit and operates for prolonged periods without any maintenance. 10.8.78 as 834985 (19pp39).

NITL ★ D14 19343B/10 ★J5 4014-3
Easily assembled tubular membrane separator - for concn., refini and desalinating liquids in food and brewing applications
NITTO ELECTRIC IND KK 04.07.77-JA-080142
(D16) (02.02.79) B01d-13

Porous support tubes are juxtaposed in a casing and connected end to end through joints to form a meanderin flow line. The tubes are arranged vertically. Each joint consists of a bend and rotatable joint, which allows the connected pipes to be relatively turnable. A liquid sepg. tubular membrane is inserted into each tube. 4.7.77. as 080142 (5pp26)

ATAD- D14 26533S/16 =NL-159-269
Liquid sterilization/pasterurization
ATAD SA (ATA -) 15.12.67-FR-132589 (18.04.67-FR-103192)
*+P34 (15.02.79) *CA-868-110 A23l-03/16 +A61l-03 B01f-07/10*

Fluids are sterilised by means of a spinning disc rotating in a fixed housing. The fluid flows from an inlet at the eye of the disc between the narrow clearance between disc and housing and out at the perimeter. The frictional forces set up in the fluid generate sufficient heat to raise the temperature to that required for complete sterilisation.

As the fluid flows between two flat smooth surfaces and in the direct of the centrifugal force, there is a regular pressure gradient from inlet to outlet and minimal risk of either local dead spots where sterilisation is incomplete or localoverheating where the fluid might boil. 18.4.68. as 005457 (13pp1370)

REMI- D14 04087A/03 =US 4141-655
Homogeniser for mixing a finely divided mass into another - has ultrasonically vibrating blade energised independently of the materials
REMIA BV 07.07.76-NL-007527
*J02 (27.02.79) *BE-856-517 B01f-11*

Appts. for homogenising a mass contg. at least two substances, at least one a fluid, comprises one or more first vibratory knives extending within the mass and rotatable about a spaced parallel axis.

A braking device prevents the mass being rotated, the device extending normal to the rotational axis of the first blade(s), and comprising a second vibratory blade extending into the mass and rotatable about an axis parallel to that of the first blade(s). Alternatively, the braking device may include a rotary impellor.

The appts. may be used for homogenising margarines, salad cream, toothpaste, cosmetic creams, paint, etc. and operates with considerably lower energy loss than known appts. 5.7.77 as 812649 (9pp1379).

D15: WATER TREATMENT

SNAM ★ D15 18035B/10 ★BE-870-215
Multistage evapn. plant to desalinate sea-water, etc. - has vertical preheater for feed water to reduce power consumption
SNAMPROGETTI SPA 14.09.77-IT-027510
(05.03.79) C02b

The plant comprises a vertical cylindrical column subdivided transversely into several cylindrical sections each contg. an evapn. stage. Each stage comprises a vertical tube bundle evaporator gravity fed with liq. from an overhead receiver supplied from the stage above, or in the case of the first stage, from a supply of raw feed water. Each stage also has a feed water preheater using steam produced in that stage.

The improvement is that the vertical evaporator and the preheater are both of ricular cross-section and the preheater extends vertically from one section partition to the next, apart from an interposed, thermal expansion joint.

This provides reduced pressure drop through each stage and greatly increases output compared with horizontal, preheater type evapn. plant, with a corresp. redn. in power consumption. 5.9.78 as 870215 Add to 801425 (14pp448)

Reciprocating sludge scraper - for sludge settlement tanks
PASSAVANTW MICHELBACHER 15.12.70-DT-061722
*(01.03.79) *DT2061-722 C02c-01/30*

A sludge scraper travelling in both directions along an extended settling tank through which the sewage flows, has its scraper suspended from a bridge. At the reversing point the scraper moves behind the collected sludge, and the journeys are carried out without any additional turbulence being caused, which would prevent sedimentation and require more energy.

The scraper shield has the form of an endless band movable on guide rollers, with openings corresponding to about half its length. The openings are always in front in the direction of motion and the sludge is collected by the full-walled section. 15.12.70 as 061722. (7pp1045)

HENK D15 49122T/31 =DS 2063-939
Water purification - using coagulating assistant alkali silicate,and quat nitrogen cpds
HENKEL KG AUF AKTIEN 28.12.70-DT-063939
*E34 J01 (01.03.79) *DT2063-939 C02b-01/20 C02c-05/02*

A coagulant for water treatment comprises an alkali silicate soln. with a molar ratio SiO_2:Me_2O >4:1 and contg. 1-15wt.% of a quat. and/or poly-quat. nitrogen cpd. (I) based on solid alkali silicate. (I) is pref. a hydroxide and the N atom is bound to an alkyl gp. e.g. $[N(CH_3)_4]OH$.

The process is carried out easily without great expenditure. Water from a paper works may be treated. 28.12.70 as 063939. (4pp068)

NEID/ ★ D15 18107B/10 ★DS 2124-202
Sewage aerating and homogenising installation - has inclined disc disintegrator rotor with sewage water supply and recirculation connections
NEIDL G 13.05.71-DT-124202
P41 (01.03.79) B02c-18/40

The sewage water is supplied into the aerating basin through a pipe with a fitted shut-off valve. The pipe connects to a suction pipe on top of which the inclined disc rotor disintegrator is installed. The base of the suction pipe rests on the bottom of the after settling tank. The disintegrator is driven by a motor mounted on top of the tank cover via a shaft extension. The disintegrator has two discharge sockets returning the water with disintegrated solids into the aerating basin.

The shaft is enclosed in a tube communicating through slots outside the tank cover with a pressurised channel, through which air is forced into the rotor space supporting in combination with the continuous water circulation the aerating process. 13.5.71 as 124202. (7pp554)

MATU D15 40275V/22 =DS 2355-893
Bactericidal membrane for water purificn - esp. disinfecting drinking water, consisting of porous water-insol substrate impregnated with adhering insol. silver salt
MATSUSHITA ELEC IND KK 14.02.73-JA-018789 (09.11.72-JA-112691)
*A91 +P73 (A14 A23 A97) (01.03.79) *DT2355-893 C02b-03/06*

A bactericide membrane for a water purifier, e.g. for household or drinking water, consists of fibrous, water-insoluble strips of smooth non-woven cloth coated with AgCl. The cloth is made of partly acetalised polyvinyl alcohol fibres or their mixts. with polyamide, polyester or polypropylene fibres.

The strips pref. are 0.01-5mm. thick and the AgCl layer is pref. 0.4-50 µm. The adhesion of the silver salt is improved thus lengthening the life of the membrane. 8.11.73 as 355893 (+9.11.72(2)-JA-112695/8) (5pp068)

FARH D15 82920Y/47 =DS 2621-698

Treating waste water, esp. from cess pits, with flocculants - then gravity filtration through textile to reduce solids and BOD

HOECHST AG 15.05.76-DT-621698

*A88 (01.03.79) *BE-854-634 C02c-01/18*

Appts. for purifying waste water comprises a supported web of fibres through which is passed the water, previously treated with flocculant, and pref. after sepg. the major amt. of pptd. material. The web is suspended as a sack-like structure and on the inner surface is formed a prim. filter layer of sepd. solids, thus building a combination filter. 15.5.76 as 621698. (3pp068)

AGRO- D15 20376Y/12 =DS 2639-836

Water treatment plant - with automatic circulation between aerator reactor and separator with floating flocculated layer NL070377)

AGROTECHNIKA NP 03.09.75-CS-005998

*(01.03.79) *DT2639-836 C02b-01/20*

The low productivity and in some systems also the high energy costs of water cleaning and purifying processes in which the matter to be removed is transferred as a suspension into a reaction zone into which the water is fed, are remedied by a new technique.

As normally, the water is set into a relatively closed line of motion, and is led, simultaneously with the suspension into a sepg. zone with a layer of flocks, where a fluid filtration of the purified water takes place. The densified suspension is transferred automatically from the upper section of the sepg. zone into the reaction zone by pressure difference in the reaction zone between the outlet from the reaction zone into the sepg. zone, and the outlet for the densified suspension from the sepg. zone into the reaction zone. 3.9.76 as 639836. (10pp1045)

PASE D15 82341A/46 =DS 2717-756

Sweeper for settling ponds - having pressure sensor which adjusts the height of sweeper above the base to prevent jamming

PASSAVANTW MICHELBACHER 21.04.77-DT-717756

*J01 (01.03.79) *DT2717-756 B01d-21/18*

Scraper mechanism for clearing away the deposits in sand traps, settling tanks, etc. on sewage farms includes a pressure sensing probe working with the drive for adjusting the height of the scraper, which puts out an impulse when a predetermined threshold value is not reached or is exceeded, which moves the scraper into the next of a series of higher or lower positions, or into its highest or lowest position.

The constantly reciprocating motion of the scraping tools is thus avoided, and they are simply moved between fixed intermediate levels based on experience, in which they remain for a period; the pressure change necessary for the motion into the next level being considerable. The reaction to the possibility of overloading in a danger zone is spontaneous, and backed-up sludge is only cleared from the top. Design is universally applicable. 21.4.77 as 717756. (8pp1045)

SULZ D15 82470A/46 =DS 2721-316

Raw sludge irradiation control - with safeguards against irregular electron beam intensity and layer thickness

GEBRUDER SULZER AG 04.05.77-CH-005556

*(01.03.79) *DT2721-316 B01j-01/10 C02c-03*

Fluid matter such as sewage sludge is irradiated by electron beams in a plant with a drum transporting the matter through the radiation zone. There is a feeder for the fluid and an applicator roller which spreads it in a thin layer on the drum. A doctor blade strips it off into a collector.

The re-infection of the matter by bacteria which have not been killed-off is prevented by a mechanism which adjusts the blade between two positions. In one, the matter passes through, whilst in the other it is recycled. The adjusting mechanism is connected to meters for the intensity of the radiation, and for the spacing of the applicator relatively to the drum. 12.5.77 as 721316. (6pp1045)

NIIM/ D15 06755A/04 =DS 2731-887

Sewage and industrial wastes treatment - in gravel filled buried basin with capillary action and fluctuating sewage level

NIIMI T 16.07.76-JA-083940

*Q42 (01.03.79) *DT2731-887 C02c-01*

In an installation for clarifying and purifying sewage, the fluid is fed first into the bottom zone of a treatment tank filled with gravel, sand and earth. It drains away over walls provided in the tank, and there is a net covering the surface of the layer of sand and gravel into which the sewage is introduced first, turned away from the inlet.

The treatment tank consists of a long box with a grid formed by bars some distance above the bottom, on which the sand-gravel-earth layer is supported. The sand-gravel layer is given a convex surface by the net. The outlet of the drainpipe is at a height which is slightly lower than the height of all the vertical walls in the box. Beneath the grid there is a pipe through which compressed air can be circulated through the grid.

The installation ensures not only better clarifying and purifying, but also the effective action of microorganisms. Even with minimal flow, the dyeing off of the microorganisms is prevented. 14.7.77 as 731887. (10pp1045)

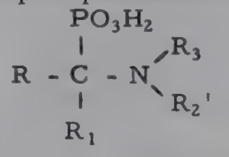
BENC ★ D15 18188B/10 ★DT 2737-259

Amino-alkane-carboxylic-di:phosphonic acid prodn. - by reacting amino-, aza-cyclo- or amino-aryl alkane-di:phosphonic acid with halogeno-alkane mono: or di:carboxylic acid

BENCKISER-KNAPSACK 18.08.77-DT-737259

E11 F06 M14 (D25 F09) (01.03.79) C07f-09/38 C11d-03/36

New N-carboxyalkane-aminoalkane-, N-carboxyalkane-aza-cycloalkane- and N-carboxyalkene-aminoarylalkene-diphosphonic acids are of formula (I).



$$R-C(PO_3H_2)(R_1)-N(R_3)(R_2')$$

(I)

In the formula, R is H, CH_3, $-(CH_2)_{10}CH_3$, C_6H_5, C_2H_4OH, CH_2COOH, or may form with R_2' a pentamethylene bridge; R_1 is PO_3H_2; R_2' is H, R_5 or may form with R a pentamethylene bridge; R_3 is $-(CH_2)_mCOOH$ where m = 2-12, $-CH_2-C(CH_3)_2COOH$ or $-C(CH_2COOH)H-COOH$.

(I) have combination of the properties of phosphonic acids and amino carboxylic acids. They can be used as complex-forming agents for di- and multivalent metals; for softening hard waters, purifying aq. effluents, for textile baths, paper prodn., tanning, stabilising dispersions and suspensions, and, esp. for corrosion preventing compsns.. 18.8.77 as 737259 (18pp70).

MERZ/ ★ D15 18189B/10 ★DT 2737-263

Portable sea water desalination plant - in compact frame with burner, fan, fin cooler and condensate collector

MERZ H 18.08.77-DT-737263

(01.03.79) C02b-01/06

Unit consists of an evaporation chamber, made of steel sheets, with a burner and ventilator at one end with a fin cooler at the other end. The sea water is partly sprayed in the evaporation chamber and partly stored in the chamber sump. An electronic control unit governs the fan and the pump for sea water and the drinking water.

This is a simple and inexpensive plant which can be easily moved even in inaccessible areas. It needs no skilled persons to operate it. 18.8.77 as 737263 (10pp39).

WIMM/ ★ D15 18225B/10 ★DT 2737-759

Sludge-thickening centrifuge - has hollow shaft-mounted drum with cylindrical filter inside drum

WIMMER O 22.08.77-DT-737759

J01 P41 (01.03.79) B04b-11

The material to be thickened is supplied into the centrifuge via hollow shaft. Due to the rotation of the drum the solid particles under the effect of the centrifugal force separate from the fluid and are deposited in a round the shaft. In the same time the solid particles con-ent decreases towards the radial channels. When the ull-up condition of the drum approaches, the amt. of olid particles separated decreases, but they are forced nstead together with the fluid towards the filter forming n auxiliary filtering layer.

The resulting pressure increase inside the drum can e picked up at the hollow shaft inlet. At a point, when no nore solid particles are removed by centrifugal force he pressure-operated control system slides shell connect-ng the two drum parts back and the accumulated solid articles are discharged. 22.8.77 as 737759 (8pp554).

IAGE- ★ D15 18238B/10 ★DT 2738-120

hermal regeneration of water treatment material - in thermal egenerating and cooling columns with heat exchanger circuits

HAGER + ELSASSER 24.08.77-DT-738120

J01 (01.03.79) B01j-01/09 C02b-01/76

Materials such as ion exchanger resins or adsorbents vhich can be thermally regenerated after they have been ised in water treatment systems, are transported by nigh-pressure water from the working column to a ther-nal regeneration column, followed by a cooling column. Heat exchangers in the circulation system for the regener-ation column heat up the circulating fluid, and for the cooling column they cool it down.

The batch regeneration results in a smaller regenerat-ion column and better thermal efficiency. Counter flow principles can be applied. The loading zone in the working column is held more constant. 24.8.77 as 738120 (35pp).

FARB ★ D15 18285B/10 ★DT 2738-720

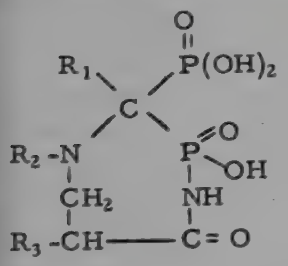
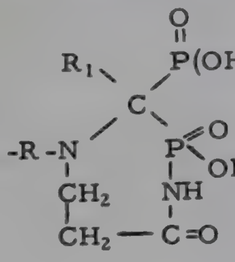
Diphosphonic acid derivs. of formula (I) and their alkali, ammonium and alkylammonium salts are new.



(I)



(Ia)

In the formulae, R_1 and R_2 are 1-18C alkyl opt. contg. double bonds and/or substd. by halo or oxyalkyl; 4-8C cycloalkyl in which ⩾1 C-atoms can be replaced by O-, N- or S-atoms, opt. C-substd. by halogen, ether groups, alkyl or aryl; or aryl contg. ⩾1 aromatic rings opt. carrying aliphatic side-chains and/or substd. by halo, oxyalkyl or oxyaryl; and R_2 can alsobe H or a group of formula (Ia) (in which R is 2-18C alkylene or arylene); or R_1+R_2 is alkylene with 3-11 ring-member C-atoms one or more of which may be replaced by hetero atoms such as O, N or S or substd. by 1-3C alkyl or halogen, the alkyl-ene group opt. being part of a mono- or dibenzo fused ring system; and R_3 is 1-4C alkyl.

(I) are sequestering agents which chelate polyvalent metal ions. They can be used e.g. in water processing; in the prodn. of detergents and cleaning agents; as paste liquefiers; in the prodn. of mortar and cement slurries; to retard setting of gypsum; in the prodn. of low-viscosity pigment suspensions; for stabilising hydrogen peroxide solutions; as additives in the prodn. of storage-stable emulsion paints; in the prodn. of photographic deve-loper solutions; as plant growth promoters for binding trace elements in soil; in the prodn. of toothpastes; and as medicaments against arteriosclerosis and osteoporosis. Specific cpds. (I) include that in which R_1 is CH_3, R_2 is C_4H_9 and R_3 is H. 27.8.77 as 738720 (26pp280).

ASAH ★ D15 18292B/10 ★DT 2743-683

Continuous adsorbent regeneration - in process for lowering COD of effluent from acrylonitrile prodn.

ASAHI KASEI KOGYO 25.08.77-JA-101068

A41 E16 (01.03.79) C02c-05

A waste water (I) treating process, (I) resulting from the prodn. of acrylonitrile by aminoxidation or being an oxidised liquid obtd. by wet oxidn. of such effluents, comprises treatment with active C in an adsorption and sepn. zone. The slurry of used C withdrawn from these zones is passed to a regeneration zone where it is wet oxidised in the presence of copper values and NH_4^+ at a pH ⩽ 5 and the thus regenerated active C recycled to the adsorption and sepn. zones.

The method ensures that low COD water is produced by constantly regenerating the active C. This regeneration, moreover is effected at lower cost (e.g. than thermal oxidn.), with lower material loss and results in an adsorbent having only slightly reduced adsorptive capacity. 28.9.77 as 743683 (36pp922).

HAWK ★ D15 18313B/10 ★DT 2834-393

Screen seal arrangement - with seal strip urged by foam base against sealing plate

HAWKER SIDDELEY BRA 19.08.77-GB-034883

A88 Q65 (01.03.79) C02c-01/22 C02c-05 F16j-15/16

A seal arrangement between a surface and another parallel surface which is movable relative to it, e.g. the edges of an endless-belt or drum screen used for screening solids out of sewage or industrial wastes, includes a channel with a sealing element in it. The sealing element protrudes outside the channel and is urged against a sealing plate on an endless chain by an elastic element at the bottom of the channel.

This seal retains its functional reliability over long periods and does not overload the screen drive by excessive friction, particularly when a pressure difference builds up as the filter becomes clogged. The seal may be made of PTFE and the elastic element of neoprene rubber. 5.8.78 as 834393 (15pp39).

MANN/ ★ D15 18326B/10 ★DT 2835-285

Digesting water purificn. sludge with worms - to facilitate dewatering or composting

MANNCHEN U 26.08.77-CH-010519

C04 (01.03.79) C02b-03 C02c-03 C05f-09/04

A sludge, which is difficult to dewater and consists at least partly of microorganisms, is treated with a sludge worm culture so that at least some of the microorganisms are digested by the worms. Treatment is carried out in a container and the sludge is converted to an easily-dewatered cake of material.

The sludge is prod. by waste water purification and is esp. a biologically-clarified sludge. Tubular worms, esp. of the genus Tubifex, are used, and the culture is pref. built up in layers. The culture may be aerated or supplied with O_2-contg. water and additionally worm nutrients, e.g. aerated or rotted clarified sludge, can be added.

The material is easily dewatered (to > 90, esp. < 85% water) and/or composted, or can be used directly as fertilizer. The method requires simpler equipment and esp. less energy than known dewatering processes. 11.8.78 as 835285 (26pp1251).

D/S: BE, FR, GB, NL.

Ca-contg. organically contaminated waste waters are purified by an activated sludge process comprising aeration with pure O_2 and/or with an O_2-contg. gas. Novelty consists of introducing a CO_2-contg. gas into the liq. present in the activated sludge system, at least periodically and to at least part of the activated sludge system. Sufficient CO_2 is dissolved in liq. to deposit part of Ca dissolved in waste water as a $CaCO_3$ ppte.

Esp. for purifying sugar refinery effluents. $CaCO_3$ pptn. reduces $Ca(OH)_2$ concn. in waste waters and lowers waste water pH to a range in which bacterial growth is improved and decompsn. efficiency is increased. Pptd. $CaCO_3$ increases activated sludge solids concn. and suppresses swelled sludge effects.

Oil-absorbing hydrophobic polyurethane foams - prepd. with lipophilic cpd. addn., have low density and low closed to open pore ratio
BASF AG 25.08.77-DT-738268
A25 H03 (A97) (07.03.79) C02b-09/02 C08j-09 C08l-75/04
D/S: BE, DT, FR, GB.

Hydrophobic polyurethane foams, having a density of 8-25 g/l and a cell distribution of 70-97% open and 3-30% closed cells, are claimed.

The foams are prepd. by a prepolymer- or by a 1-shot process, from organic polyisocyanates, polyhydroxy cpds, blowing agents, catalysts, opt. chain-extenders, auxiliaries and additives, with the improvement being characterised in the addition of lipophilic cpds. (I) consisting of opt. substd., saturated and/or unsaturated, aliphatic 10-25C fatty acids, their esters and amides.

Esp. in absorbing oils and/or opt. halogen contg. hydrophobic cpds. from water.

The foams can be prepd. in situ, e.g. on the open sea, and spread directly on water surface. Chemical structure, density and open : closed cell ratio increase foam absorption capacity for crude-, heating- and diesel oil, and for hydrophobic cpds., e.g. solvents, such as hexane, benzene etc. In an example, oil absorption using a foam having a bulk wt. of 12 g/l and a closed cell content of 8% was 525 wt.% after 24 hrs., compared to 125 wt.% using a foam having a bulk wt. of 40g/l and contg. 35% closed cell cells.

Removal of heavy metals from water - by pptn. using gamma di:calcium silicate

BLUE CIRCLE IND LTD 17.08.78-GB-033690 (25.08.77-GB-035692)

(07.03.79) C02b-01/18

Heavy metals are removed from an aqs. system by addn. of gamma dicalcium silicate (I) to insolubilise the heavy metal present.

(I) is not too reactive, and does not agglomerate, and has a high capacity. The sediments are easily filtered. 17. 8. 78 as 033690 (4pp955)

UBEI ★ D15 18570B/10 ★J5 4010-557

Finely dispersing coagulated sludge slurry in liquid - by adding waste oil etc. to form high viscosity emulsion then adding e.g. polyoxyethylene alkylphenyl ether

UBE INDUSTRIES KK 27.06.77-JA-076420

A97 (26.01.79) C02c-03

Coagulated sludge slurry resulted from concentrating by settling a surplus sludge in activated sludge process with coagulant in thickener etc., is dispersed and suspended in liquid as fine granules by (i) adding oil, e.g. C-heavy oil and waste oil etc. followed by agitation to form high viscous emulsion, and (ii) adding an additive, e.g. polyoxyethylenealkylphenylether etc. in amt. of 3 wt.% followed by agitation to convert the high viscous emulsion into lower viscous emulsion by emulsion destruction.

The sludge dispersion obtd. is easily sprayed from nozzles into a simple spraying-type combustion furnace without any clogging. The sludge dispersion is easily transferred by means of a conventional pump without use of screw feeder etc. and without filtration and dewatering etc. 27.6.77. as 076420 (4pp34)

LIOY ★ D15 18571B/10 ★J5 4010-558

Treating waste water contg. grease from hides, etc. - using calcium oxide or hydroxide to separate solvent, surfactant, etc.

LION FAT & OIL KK 27.06.77-JA-076416

E33 (D18) (26.01.79) C02c-01/40

Treatment of waste water is claimed resulting from removal of natural grease etc. from hide, skin, fur and pelt etc. with aq. defatting agent prepd. by dispersing an organic solvent, e.g. lower boiling paraffins and petroleum solvent etc. in water with nonionic surfactant, e.g. belonging to ethyleneoxide-type. Waste water is purified economically and effectively to remove the organic solvent, surfactant and grease etc. by adding CaO, $Ca(OH)_2$ or $Ca(OH)_2$ slurry in amt. such that the $Ca(OH)_2$ concn. becomes 1,000-5,000 ppm, and subsequently allowing the mixt. to stand at 60-120°C, so that the solvent, surfactant, the grease or its saponificated prod. are effectively settled with flocs of $Ca(OH)_2$. 27.6.77. as 076416 (4pp34)

DAIK- ★ D15 18572B/10 ★J5 4010-559

Electrolytically treating waste water to remove phosphorus component - using iron as the anode and aluminium (alloy) as the cathode

DAIKI GUM KOGYO KK 24.06.77-JA-075088

E36 J03 (26.01.79) C02c-05/12

P component is removed by electrolysis from waste water using Fe as the anode and Al (alloy) as the cathode. PO_4^{3}-ions contained in the waste water are pptd. as $Fe_3(PO_4)_2$ and $FePO_4$ on reacting with Fe^{2+} and Fe^{3+} (which is resulted by oxidation of Fe^{2+}) dissoluted from the anode. The Fe ions present after the electrolysis (including those previously contained in the waste water) are reacted with aluminate ions dissoluted from the cathode to form flocs.

Process is effected of very low running costs without making the waste water red coloured due to surplus Fe ions or causing adhesion of scales to the surface of the anode.

Continuous operation is possible with nominal pH variation. 24.6.77. as 075088 (3pp34)

KOKC ★ D15 18573B/10 ★J5 4010-560

Removing e.g. snails and flies, from waste water - by adding cpds. releasing calcium or iron ions and/or inorganic coagulant

KOKOKU CHEM IND KK 24.06.77-JA-075114

E37 (26.01.79) C02c-01/02

Fresh water-type large size life e.g. snail, fly, etc. generated abnormally in treatment of organic waste liquor, e.g. domestic waste water and food-processing waste water etc. with microorganisms in treating appts. and in attachments thereof, are exterminated at low cost without reducing waste water treatability, having effective microorganisms or creating secondary pollution.

Process comprises adding to the waste liquor a Ca ion- or Fe ion-releasing cpd. (I) and/or an inorganic coagulant (II), e.g. Al sulphate, Fe chloride, lime, ferrous sulphide etc. (I) and/or (II) are partially flocculated after use, but they still remain in the water.

These cpds. exhibit acidity in the water and are therefore easily flocculated by neutralising with NaOH etc. if necessary together with polymer coagulant and removed from the water. 24.6.77. as 075114 (3pp34)

MOEN- ★ D15 18574B/10 ★J5 4010-561

Purifying condensed water contg. organic cpds. - e.g. from protein feed prodn., by adding sea water and propagating microorganisms in it

MO ENGINEERING KK 25.06.77-JA-075920

(26.01.79) C02c-01/02

A lower boiling org. cpds.-contg. condensed water, e.g. recovered in the prodn. of protein feed by heating e.g. meat, blood, entrails, etc., so as to be solidified and coagulated, or in spray drying of milk or wet combustion of pulp mill effluent, is purified, without being blended with other effluents, by adding sea water such that the salts concn. becomes >50 mg/l., and propagating microorganisms so that they are decomposed.

The elements necessary for growth of the microorganisms, e.g. K, Na, Ca, Mg, S, Cl, Fe, Mn, Co, Cu, Zn, Mo, Al, etc., are easily and simply supplied by adding sea water. 25.6.77. as 075920 (2pp34)

Freezing and remelting sludge to improve dewatering - using a device which has a valve structure to prevent treated and untreated sludge from mixing

MITSUBISHI ELECTRIC CORP 28.06.77-JA-077414

(26.01.79) B01d-43 B01j-01 C02c-03

Sludge is treated in such manner that it is once frozen and remolten to improve the dewatering facility. The device comprises pipes vertically arranged in a frame, upper and lower chambers disposed around the pipes in the frame. A raw sludge is fed into a lower space of each pipe with pressure; cooled by a coolant, flowing in the lower chamber; molten by a heating medium fed into the lower chamber, until only the surface layer is molten; pushed up into an upper space of each pipe; and molten entirely by a heating medium fed into the upper chamber. The novelty is that a valve structure is disposed at an upper opening of each pipe so as to be opened by the pushed up sludge and opened due to melting of the sludge.

The raw sludge is prevented from mixing with the treated sludge. 28.6.77. as 077414 (4pp26)

NITT ★ D15 18675B/10 ★J5 4011-083

Coagulating agent - of improved dehydrating and coagulating activity

NITTO CHEM IND KK (MITR) 28.06.77-JA-076097

A91 J01 (26.01.79) B01d-21/ C08f-02/10 C08f-20/54*

Coagulating agent is obtd. by aq. soln.-polymerisation of acrylamide or water-soluble monomers consisting mainly of acrylamide, effecting polymerisation in the presence of 0.5-15 wt.% (based on the amt. of the monomer) of alkylene oxide addn. cpd. of a cpd. having active H or water-soluble cpd. of mol.wt. 400-20,000 obtd. by substituting terminal hydroxyl hydrogens of the addn. cpd. using radicals of other hydroxyl cpds. or carboxylic acid radical in the polymerisation system of monomer concn. >15 wt.%, if necessary, partially hydrolysing it, drying, and pulverising it.

Resulting acrylamide system polymer polymerised in the presence of polyethylene glycol, etc. can be completely dissolved within 1 hr., in contrast with 2-4 hrs. taken for dissolving previous acrylamide system polymer of comparably high mol.wt., and exhibits excellent dehydratability in esp. vacuum filter process. 28.6.77. as 076097 (7pp50)

MITQ ★ D15 18926B/10 ★J5 4011-876

Device for freezing and remelting sludge - in a heat exchanger with heat carrier media which are prevented from mixing

MITSUBISHI ELECTRIC CORP 29.06.77-JA-078007

(29.01.79) B01d-43 B01j-01 C02c-03

The sludge is once frozen and then remolten in a heat exchanger provided with heat carrier media for absorbing the heat from the exchanger and for radiating the heat to the exchanger, and a circuit for switching and circulating both media. The object is to avoid mixing one medium with another upon switching them, thus eliminating the heat loss due to mixing. A flow line is provided for extracting either carrier medium from the heat exchanger before switching both carrier media.

A remelting tank is put on a freezer tank and both tanks are connected to sludge reservoirs through flow lines with valves. The heat exchanger surrounds both tanks. The carrier media are brines. 29.6.77. as 078007 (5pp26)

NIRA ★ D15 18929B/10 ★J5 4011-879

Device for continuous ion exchange in waste water - has sepn. plates at top and bottom of ion exchange to form resin packing chamber

UNITIKA KK 30.06.77-JA-078644

(29.01.79) B01j-01/06 C02c-05/08

Device for continuous ion exchange in a waste water on a large scale, comprises an ion exchange column having an inlet at the lower end and outlet at the upper end and contg. a moving bed of ion exchange resin. The resin is efficiently packed and discharged.

Sepn. panels are disposed in an upper and lower end space of the column to form a resin packing chamber in a middle space of the column. A solid-liquid distributor for packing the resin is disposed in an upper section of the chamber and an auxiliary liquid distributor for draining the resin is disposed in a lower section of the chamber, near its lower end. Both distributors extend horizontally. 30.6.77. as 078644 (2pp26)

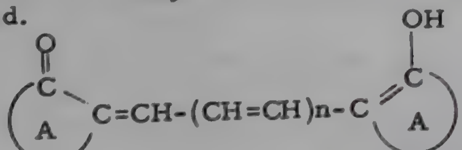
Treating washing liq. contg. blue colouring agents - using chlorine-type bleach and/or bacteria

YAMAMOTO KAGAKU GOS KK (SAKI) 28.06.77-JA-077464

E23 (29.01.79) C02c-01

Treatment of a vlue-coloured washing water used in washing of seating e.g. stools in vehicles, aircrafts and ships etc., contg. ≥1 colouring agent of formula (I) is claimed.



(I)

Ring A is a 1-phenyl-3-substd.-5-pyrazolone ring, the phenyl contg. as substits. ≥1 of sulphonic acid and carboxylic acid residue which are in form of salt with alkali metal, alkaline earth metal, ammonium or lower alkyl ammonium ion, the acid residue being if necessary connected with the phenyl radical via lower alkylene radical; the 3-substd. radical is ≥1 of lower alkyl, carboxyl and lower alkoxycarbonyl; position 4 is substituted with methine radical, the H atom of which may be replaced with lower alkyland n is 0-2. The washing water is easily and completely decolourised by treating it with a chlorine-type decolouring agent, e.g. hypochlorite etc. and/or bacteria. 28.6.77. as 077464 (11pp)

MITQ ★ D15 19008B/10 ★J5 4012-147

Purifying effluent contg. nitrous ions and sulphur oxide(s) - the amt. of ammonia added depending on the washing effluent flow rate

MITSUBISHI ELECTRIC CORP 29.06.77-JA-078008

E36 J01 (29.01.79) C02c-05/04

Effluent contg. NO_2^-, SO_3^{2-} and $S_2O_3^{2-}$ is purified by introducing a certain amt. of the effluent into an oxidising vessel at pre-determined intervals, so that $S_2O_3^{2-}$ and SO_3^{2-} are oxidised to SO_4^{2-} with ozone at pH > 7; controlling the amt. of ozone to be added such that the variation in the NO_2^- concn. is less than the pre-determined value before and after the oxidn. of SO_3^{2-} and $S_2O_3^{2-}$ to SO_4^{2-}, by detecting the NO_2^- concn. of the effluent by UV-adsorption; adding NH_3 or ammonium salt to the effluent in step (1) in an equimolar amt. with the concn. of NO_2^{2-} detected in step (2), and adjusting to pH > 7 to form ammonium nitrite; and introducing the effluent into a decomposing vessel at the same intervals as that determined in step (1) and heating at <60° C to decompose NO_2^{2-} to N_2.

The effluent is obtd. by oxidising nitrogen oxides in the exhaust gas to NO_2 with ozone and washing the NO_2-contg. exhaust gas with aq. alkali sulphite and sulphate-contg. soln. to fix the NO_2 as NO_2^- in the soln.

The NO_x content is controlled and the amt. of NH_3 to be added depends on the variation in washing effluent flow rate. 29.6.77. as 078008 (6pp34)

NIYA- ★ D15 19009B/10 ★J5 4012-149

Treating hexavalent chromium-contg. alkaline waste water - resulting from the descaling of (stainless) steel, with addn. of ferrous cpd.

NIPPON YAKIN KOGYO 29.06.77-JA-078982

E31 M12 (29.01.79) C02c-05/02

Treatment of Cr^{6+}-contg. alkali waste water(having pH of 7-14) resulting from the immersion of steel or stainless steel in fused alkali metal salt to remove the scales and washing the (stainless) steel thus treated with water to remove the alkali metal salt from the surface, is claimed

Waste water is subjected to automated economical reducing treatment (Cr^{6+} - Cr^{3+}) by calculating the final oxidn.-redn. potentials in accordance with the pH values of the waste water, adding Fe^{2+}-contg. cpd. until the final oxidn-redn. potential to reduce Cr^{6+} to Cr^{3+}, and subsequently neutralising with an acid, e.g. waste acid resulted from an acid-washing bath in the fused alkali metal salt process.

Cr^{6+} is easily reduced to Cr^{3+} with Fe^{2+} in alkali soln. and pptd. as $Cr(OH)_3$, in this case the oxidn. redn. potential is in accordance with the unreduced Cr^{6+}, thereby it becomes possible to carry-out automated control.

The Fe^{2+}-contg. cpd. is added until the final oxidn-redn. potential calculated from the expression: $Y=30.64X^2-826.36X+5442.82$ (where Y represents the final oxidation reduction potential and X represents the pH value) and the automated control is effected within a specified area. 29.6.77. as 078982 (4pp34)

Treating effluent from wet nitrogen oxide removing process - in evapn.-concn. process

SHOWA DENKO KK 01.07.77-JA-077943

C04 E37 (01.02.79) C02c-05

An effluent contg. a large amt. of sulphates, e.g. $Ca(NO_3)_2$, $Mg(NO_3)_2$ and $Fe(NO_3)_2$ etc., resulted in removing NO_x by oxidn. with O_3 from exhausted smoke under wet state, is passed through evapn. concentrating tower(s) such that the water content, except the water required for water of crystallisation for the crystals formed on cooling of the effluent in the final evapn. concentrating tower, becomes less than 10%. The conc. liquor in a fluidised state is removed, and the liquor is allowed to cool for crystallisation and recovery.

The evapn. concn. is effected to some degree by contacting it with exhausted gas discharged from a boiler in the evapn. concentrating tower. The recovered prods., e.g. $Ca(NO_3)_2.4H_2O$ $Mg(NO_3)_2.6H_2O$, $Fe(NO_3)_3.9H_2O$ $CaSO_4.2H_2O$ and $MgSO_4.7H_2O$ etc. are suitably used as fertiliser etc. The process is very economical with effective heat utilisation and results in no pollution as a closed system is used. 1.7.77. as 077943 (7pp34)

FUIT ★ D15 19335B/10 ★J5 4014-366

Recovery system for high purity water - used for washing semiconductor wafers for integrated circuits, incorporates two/stage washing process and water recycle

FUJITSU LTD 05.07.77-JA-079482

(02.02.79) C02c-05

Fresh water is purified to a super-purity water in a polishing appts. The super-purity water is storaged partly in the first washing tank where the material for semiconductor is washed after being treated with various chemicals. The water used in the first washing tank is discharged and the super-purity water not storaged in the first washing tank is recovered. The recovered water polishing line contains the second washing tank, a recovery tank where the super-purity water used in the second washing tank is recovered, and a recovered water polishing appts. where the super-purity water in the recovery tank is subjected to polishing to send to the second washing tank for storage.

The method, featuring a two-stage washing process; i.e. the super-purity water used in the first washing tank is discharged and the water used in the second washing tank is recycled for reuse after polishing obviates the need to monitor the quality of water by using a sensor, and miniaturises and simplifies the polishing appts, thus ensuring a simplified, exact, and inexpensive recovery of super-purity water. 5.7.77. as 079482 (3pp)

SUMO ★ D15 19337B/10 ★J5 4014-368

Deodorising animal excreta, sewage (sludge), activated sludge, etc. - by treating with agent obtd. by treating moisture rich organic waste with calcia or magnesia, and mixing prod. with adsorbent

SUMITOMO CHEMICAL KK 04.07.77-JA-080122

C04 P34 (D22) (02.02.79) A61l-09 B01d-15 B01j-01 C02c-03

Moisture-rich organic waste is first treated with 0.1-0.5 equivalent of CaO and/or MgO on the basis of its moisture content to obtain a dried powder, and the dried powder thus obtd. is mixed with a 5-100 wt.% adsorbent, e.g., diatomaceous earth, bentonite, activated carbon, etc. to produce a deodorant which is used by spreading, mixing, etc. in a quantity sufficient to cover the offensive odorous substances.

Deodorant effectly adsorbs and remove N- or S-contg. gases and suppresses the formation reactions of malodorous substances by microorganisms, e.g., the decompositing reactions of protein, thus greatly contributing to the prevention of environmental pollution. The deodorant, after being used, can be diverted to fertiliser or soil stabiliser. 4.7.77. as 080122 (4pp117)

Water purifying agent prepn - by moulding then rapidly heating powdered zeolite, foaming agent and binder

HASHIMOTO S 31.08.73-JA-098044

*A97 G04 +P14 (13.02.79) *J50048-746 +A01k-64/02 B01d-15 B01d-39/06 C02b-01/16 C02c-01/40 C02c-05/08*

Powdered zeolite, org. foaming agents, and binders which are effective in the presence of water are mixed and moulded, the moulded prod. is rapidly heated inside and out simultaneously to make foaming instantaneous, and the foamed prod. is dried to give a porous water-purifying matl. Opt. the foamed prod. is activated and sintered by heating. The prod. absorbs NH_4^+ selectively, and hence it is suitable to obtain high quality water for fish hatcheries, fish ponds, hydroponics, and transportation of live fish and flowers.

In an example, 100g powdered zeolite (200 mesh) was mixed with 40 ml. of 1% CM cellulose and 7g of foaming agent ('Serumaiku A'). The mixt. was pelletised, foamed by heating, and sintered at 700° for 1 hour. The pellets 1.5g were placed in a cup which was filled with tap water, and fresh-cut flowers were placed therein. The flowers in the treated water kept their freshness after 1 week, whereas the flowers in untreated tap water wilted. 31.8.73 as 098044 C02b-1/16; B01d-15/00; C02c-1/50; 5/08; A01k-64/02; B01d-39/06 (13.2.79) HASHIMOTO, S. Water purificn. using upflow through sand bed - with underlying circulating water zone centrifugally removing larger solid particles

MIDCON PIPELINE EQ 25.10.77-US-845341

(27.02.79) B01d-29/36 C02c-01/04

Water to be purified is introduced tangentially into a zone immediately beneath the bottom of a sand bed of circular horizontal cross-section. This uniformly distributes the water beneath the sand bed and throws relatively large solids to the sides of the zone. A body of water is maintained in this zone in a swirling motion and the larger solids settle through this.

The water is passed upwardly through the sand bed at ~6 inches per min. The water exiting from the top of the sand bed is passed upwardly through a settling chamber above the sand to remove any suspended sand particles from it. Purified water is withdrawn from the top of the appts.

The method is used for water purificn. and clarification Close down of the appts. for backwashing is minimised. 25.10.77 as 845341 (10pp295).

STWE ★ D15 19901B/10 ★US 4141-825

Desalination and purification of water - using electrodialysis unit, moderate pressure reverse osmosis unit and high pressure reverse osmosis unit

STONE & WEBSTER ENG CORP 31.10.77-US-846779

(27.02.79) B01d-13

In the purificn. and desalination of water contg. 500-36000ppm. salt, the appts. used includes three separate units comprising an electrodialysis unit, a moderate pressure reverse osmosis unit and a high pressure reverse osmosis unit. Reject from the electrodialysis unit is delivered to the moderate pressure reverse osmosis unit and reject from this unit is delivered to the high pressure reverse osmosis unit.

Prod. water from each of the units is blended to produce a prod. stream. The prod. water from the first two units contains <500ppm. salt while the prod. from the final stage contains 300-800ppm. When the prod. of the third unit is >500ppm. it is pref. recycled to the dialysis unit for further desalination. 31.10.77 as 846779 (9pp295).

*(27.02.79) *DT2735-892 C02c-05/04 +C02b-01/34*

Ammonia-contg. waste water is treated by subjecting at pH ⩾9 to wet oxidation with an oxygen-contg. gas in the presence of a catalyst, maintaining water at 100-370°C and at pressure permitting waste water to remain in liq. phase.

Catalyst is supported by a carrier comprises ⩾1 of iron, cobalt, nickel, ruthenium, rhodium, palladium, iridium, platinum, copper, gold, tungsten and their water-insoluble cpds. Pref. pH is 10-12.5. Catalyst comprises ruthenium chloride and platinum chloride or ruthenium sulphide and rhodium sulphide as active component.

Process is greatly simplified reducing costs by use of a one-step reaction substituting a multistage process. 10.8.77 as 823496 (6pp931).

FARB D15 19659A/11 =US 4141-829

Treating waste water contg. organic matter by oxidn. - to carbon di:oxide and water at high temp. and pressure

BAYER AG 09.09.76-DT-640603

*(27.02.79) *BE-858-542 C02c-05/04*

Organic substances dissolved or dispersed in aq. system are oxidised with a gas contg. molecular O_2 at elevated temp. and pressure to CO_2 and water, with subsequent phase sepn. into gaseous phase contg. inert gas, CO_2 and steam and liq. phase contg. water.

Pressure is adjusted at given temp. so that ratio of total pressure (Pt) to partial pressure of steam in reaction soln. (Pw) is 1.05-1.5 and so that by evapn. of water from aq. system, more steam than exothermicity of the oxidn. reaction goes into aq. phase which is fed to a heat exchanger, in which amt. of heat needed to maintain oxidn. temp. is transferred to water and oxygenated gas which flows on other side of heat exchanger and subsequently fed to the reactor.

Used esp. to feed inorganic constituents, after the oxidative degradation of the organic substances to a reuse or recovery process. 2.9.77 as 830295 (6pp934).

UNIC ★ D15 19904B/10 ★US 4141-831

Appts. for removing solids from sedimentation tank - with scraper blade liftable at ends of tank to prevent solids accumulation

UNION CARBIDE CORP 25.10.77-US-844986

(27.02.79) C02c-01/08

In a sedimentation appts. a solids collection trough extends along the bottom length of the settling tank. A reciprocating bridge travels along the length of the tank and this supports a scraper blade, one end of which is adjacent the trough, the other end being adjacent a side wall.

The blade at its end adjacent the wall is supported by two telescoping tubes, the upper being connected to the bridge and the lower to the blade. At its other end a flexible cord interconnects the bridge and blade for drawing the blade in trailing relationship to the bridge as the bridge moves along the length of the tank. Near the end of the tank the suspended length of the cord may be shortened so that the scraper blade is lifted adjacent the end walls of the tank. The blade is again lowered as the bridge begins its travel in the opposite direction.

The appts. is used in a sedimentation appts., e.g. in an activated sludge sewage treatment process. The vertical movement of the blade at the ends of the tank prevents accumulation of solids in these regions. 25.10.77 as 844986 (17pp295).

Microbiological prodn. of single cell protein - using genetically modified ammonia fixing microorganisms
IMPERIAL CHEM INDS LTD 08.09.77-GB-037559
(D13) (05.03.79) C12d C12k

Prodn. of single-cell protein comprises aerobic culture of microorganisms contg. genetic material specifying the fixation of NH_3 by the glutamate dehydrogenase (GDH) route. Novel methanol-utilising aerobic microorganisms are genetically modified by DNA or plasmids, plasmid hybrids phages or plasmid hybrids to give specific NH_3 fixation by the GDH route.

The modified microorganisms cause conversion of MeOH by the single-stage GDH route rather than the usual two-stage glutamate synthetase (GS) route. This leads to less conversion of MeOH into CO_2 and a less exothermic reaction, so that less cooling is required to maintain the system at the pref. temp. of 34-45°C. 4. 9. 78 as 870188 (17pp941)

ROTO- ★ D16 18082B/10 ★BE -871-661
Machine to chop vegetable waste for compost - uses elliptical blades rotating in cylindrical drum as stationary chopper or lawn mower type arrangement
ROTOCROP INT LTD 31.10.77-GB-045276
P41 (15.02.79) B02c C05f

The machine comprises a rotary cutting shaft fitted with elliptical blades. The blades are set at an angle to the shaft so that the peripheral cutting edges of the blades describe a cylindrical path as the shaft rotates. A fixed blade set along the cylindrical path provides a shearing edge to cooperate with the rotating blades.

The cutting shaft assembly is pref. housed in a coaxial, cylindrical drum having inlet and outlet longitudinal slots, pref. diametrically opposed. The edge of the inlet slot conveniently serves as the fixed blade. The foregoing assembly can be mounted on a free-standing framework or on a wheeled carriage, esp. as a lawn mower in which the drive to the cutting shaft is transmitted from the ground traction drive, either manual or motorised. 30. 10. 78 as 871661 (17pp448)

Enzymatic analysis using nitro-styrene derivs. - e.g. determination of N-acetyl-beta-d glucosaminidase to detect renal troubles is simple and gives visual signal
NATIONAL RES DEV CORP 01.11.77-GB-045390
B04 J04 R16 (15.02.79) G01n

Reagent for analysis of an enzyme contains a substance capable of reacting with the enzyme and form a cpd. of formula $X-A-Y-NO_2$ (I) (where A = an aromatic ring; X= an auxochrome radical and Y = an unsatd. radical which is capable of transmitting the electronic resonance between the aromatic ring and the nitro radical) which is capable of producing an easily discernable visual signal.

Used in detection and determination of enzymes e. g. catabolic enzymes such as carboxylate esterases, lipases, alkaline and acid phosphatases, sulphatases, and phosphodiesterases; glycosidases e. g. N-acetyl-β-D-glucosaminidase (detection of this enzyme gives an indication of renal troubles or advance warning of rejection of a kidney graft). The invention may also be used to determine absence of enzymes e. g. to reveal genetic problems. 31. 10. 78 as 871717 (37pp395)

Stable odour-free organic fertilizer - by homogenizing, drying and removing foreign bodies from household refuse
R UTI R SRL 16.04.75-IT-049144
*C04 +P41 (07.03.79) *BE-840-735 C05f-09*

A fertiliser is produced from city solid wastes in which the starting material, comprising an organic prod. which is a fraction from city solid waste comprising organic prods. and mould, is first homogenised, then classified to separate non-organic foreign bodies, and is dried.

After drying, organic material is pref. freed from remaining non-organic relatively heavy bodies, and then subjected to redn. and/or pulverisation, then sterilised in an autoclave under pressure.

Prod. can be directly pelletised and sacked or mixed with different chemical prods. then pelletised and sacked. Degree of moisture of pord. is $<20\%$ total and it can be stored for a very long time without deterioration. 7. 4. 76 as 014132 (2pp931)

Culture fluid microorganisms concentration monitor - has pump connected to optical measurement cell and to fermenter

BIOL INSTR DES BUR (ASMI=) 06.02.74-SU-381138 (06.02.74-SU-995414)
R16 (17.03.78) C12b-01/08 G01n-33

The unit determining the concentration of microorganisms in the culture fluid improves accuracy of the optical measurements. The suction end of the pump is connected to the measuring cell, while the delivery is connected to the fermenter. The pipe discharging the foamed fluid is fitted in the top of the gas separating vessel, and is connected to an additional pump evacuating the foamed fluid from the vessel for transfer to the fermenter.

The pumps feed the culture medium from the lower part of the fermenter into the gas separating vessel. The culture medium spills out through the drain pipe into the evacuated space of the gas separating vessel with gas bubbles and foam returned to the fermenter by a pump. The microbiological medium free of gas and foam forms a settling column outside the overflow leading to the optical measurement cell.

Microorganisms culture automatic control - sets flow rate of coolant to match intake of air

OIL CHEM AUTOM RES 22.03.76-SU-336857
(14.03.78) C12b-01/08

Improved efficiency in the automatic control of microorganisms growth is due to adjustment of coolant flow rate as a function of air input. The ratio of air fed for aeration and of the coolant flow rate characterises the temp. dependence of the nutrient in the unit.

The physiological development of microorganisms is reflected in intensified breathing which causes increased heat evolution and a higher concentration of CO_2. The latter is detected by the gas analyser and leads to a larger output signal of the controller enduring the rise of air flow rate into the unit. The signal from the air flow transducer is transmitted to the ratio controller whose output drives [illegible] of the coolant. The pressure in the unit is stabilised with a controller acting on the servo ensuring the exhaust of the spent gases.

Microorganisms continuous disintegrator - has top and bottom flanged housings with disc seats controlling working slot
PROTEIN BIOSYNTH 30.12.74-SU-092098
(17.03.78) C12k-01/10

Simplified disintegrator of microorganisms and reliable long-term operation are ensured by using flanged top and bottom housings mounted to shift vertically. The two housings have disc seats, the lower one featuring a projection forming a working slot with the outside surface of the top seat. The top housing has a channel for the inlet of the suspension into the working slot, and a shock absorber is fitted between the lower housing and the seat. After setting the limit pressure in the valve, the metering pump is switched on for continuous feeding of the cell suspension into the mixer and receiver. The rise of level in the mixer causes the float of the level sensor to open the admission of gas for bubbling through the suspension. After the gas saturation, the material is transferred to the distintegrator where pressure and decompression are adjusted by screws. Increase of pressure deflects the lower seat on the shock absorber leaving a working gap between the seats. The decompression breaks up the cells before the suspension reaches the accumulating vessel for discharging.

(17.03.78) C12k-01/10

Simplified control of the disintegration of microorganisms is ensured by providing an additional projection on the seat in the lower housing. The working gap is bound by the main and additional ring projections and by the surface of the disc seat in the top housing. The latter seat has several recesses communicating with the channel feeding the suspension. The recesses distribute the suspension in the working gap, while the processed suspension is drained off by the channel in the seat of the lower housing.

The cell suspension saturated with gas is fed to the disintegrator, where it first reaches the seat of the top housing to flow into the working gap through the radial channels. The disintegration of the microorganisms is due to decompression, and the treated suspension passes the channel of the bottom housing and flows towards the collector.

Vegetable raw material hydrolysate neutralisation - with pyrolysed mixt. of calcium carbonate and hydrolysed lignin, used in alcohcl and feed-grade yeast mfr.
GELFAND E D 01.08.76-SU-389123
C03 (D13) (15.03.78) C13k-01/04

The reagent for the neutralisation of vegetable raw material hydrolysate is useful in the alcoholic fermentation and yeast biomass prodn. for use in animal feed. The reagenit is prepd. by mixing 15-50 pts. wt. calcium carbonate with 50-85 pts. wt. hydrolysed lignin, and subjecting the mixt. to pyrolysis at 600-1000°C for 30-80 mins. The use of this reagent gives neutralised hydrolysate with low calcium sulphate and organic impurities content, and it accelerates the process.

Thermally sensitive material dryer - has drying chamber placed above inert heat carrier filled chamber to intensify drying process
AS BELO HEAT MASS 30.07.74-SU-047201
J07 Q76 (21.03.78) F26b-05/16 F26b-17/10

The dryer can be used for material such as micro-biological pastes and solns. and can be employed in medical, chemical and food inds. It contains a drying chamber and a chamber filled with fluidised inert dispersing heat carrier layer. The chambers are connected to one another by a capilliary porous wicks.

To intensify the drying process, the drying chamber is situated above the inert heat carrier filled chamber. The two chambers are separated by a gas removal box with a perforated lower wall. The wick is made as a system of branched rods, mounted in the chamber drying zone to replaceable solid body.

Grape juice sampler - uses hydraulically operated curved tubes removing and crushing pulp from hopper, and having run/off for juice
CRIMEA GLAVPRODINTO 08.12.75-SU-198451
R16 (27.03.78) G01n-01/20

Sampler for use in viticulture takes a sample of pulp from a hopper and if operated further squeezes it and provides a quantity of clean juice, removed by vacuum pump. The sampler has no rotating parts or packings, and this prevents contamination.

The sampler consists of a hydraulically-suspended harness, integral with a pivot, on which two levers, driven downwards by hydraulic cylinders, swing to push down into the hopper of pulp, the quater-circle curved cylinder, with chamfered entry, and similar curved tube, carrying an end plug and a short stem with crusher having conical holes. The tube rides over rigidly mounted inner tube.

FISH= ★ D16 19640B/10 ★SU-603-367
Agaroid prepn. from Black sea phyllophora algae - using two/stage extn. at controlled pH to increase yield and quality
AZOV-BLACK SEA FISH (SEAF) 30.12.76-SU-436727
(29.03.78) A23l-01/04

Prepn. of gelatinous agaroid from Black Sea Phyllophora nervosa red-algae is based on two-stage extn. at controlled pH to give increased yield and quality. The first extn uses 0.4-0.8% agaroid soln. at pH 7.2-7.8 and 95-100°C for 1-1.5 hrs. Acid is then added to give second extn. at pH 7.0-7.3 and 85-90°C for 0.5-1 hr.

The basic air-dry algae is treated at 80-85°C with 2-3% alkali soln. for 2 hrs. before extraction stages. During the first extn. the agaroid in soln. quickly swells into the algae but the presence of polysaccharides and the pH control prevent inclusion of pigment and protein cpds. into the extract. In the second stage, the high mol. polysaccharide fraction diffuses into soln. Their presence increases gelatinous props by 30-40% and yield by over 20% compared to one-stage method.
Boidyk, N.M., Zambriborsh, R.F., Mukulich, D.V. et al
Bul. 15/25.4.78. 30.12.76. as 436727(2pp114)

MASW ★ D17 18235B/10 ★DT 2738-110
Flat-bottom sugar centrifuge - with shell of uniform wall thickness and shrunk reinforcing rings near perforations
MASCH BUCKAU WOLF R 24.08.77-DT-738110
P41 (01.03.79) B04b-07/18

Flat bottom centrifuge with a pendulum suspension for the sepn. of white sugar and syrup has perforations in the shell near the bottom and near the cover for the outflow of the syrup. The thin-walled shell of uniform wall thickness which is not machined on the inside or outside carries shrunk-on reinforcement rings at a distance of 10-15% of the shell dia. from the bottom and from the cover.

This results in much lower mfg. costs than for a bowl with thicker walls near the bottom and the cover which has to be machined out of the solid; it also is a more durable design and has a greater capacity. 24.8.77 as 738110 (21pp39).

JAOR ★ D17 18770B/10 ★J5 4011-245
Sugar soln. treatment - by passing through strong acidic cation exchange resin , weak-medium basic anion exchange resin, weakly acid anion exchange resin, etc.
JAPAN ORGANO KK 28.06.77-JA-076179
(27.01.79) C13d-03/14 C13f-01/14

A sugar soln. is passed in order through a bed of strongly acidic cation exchange resin, a bed of weakly - or medium-basic anion exchange resin, a bed of weakly acidic cation exchange resin, and through a mixed bed comprising strongly acidic cation exchange resin and strongly basic anion exchange resin. The soln. is passed through the weakly- or medium-basic anion exchange resin immediately after passing a regenerating soln. out. The weakly acidic cation exchange resin is regenerated by waste regeneration soln. for the strongly acidic cation exchange resin.

By placing a bed of weakly acidic cation exchange resin between weakly- or medium basic anion exchange and strongly acidic cation exchange- strongly basic anion exchange resin beds, sodium hydroxide eluted from the anion exchange resin is removed. This reduces the

SCHEDULE OF FUTURE DESPATCHES

Due to a recent computer failure resulting in disruption of our production schedules, and to allow for the recent Easter Holidays, the despatch of materials will be a few days later than the usual Wednesday date for the next few weeks, but will return to normal by Wednesday 16th May. We apologise in advance for any inconvenience that these delays may cause to subscribers. The schedule for the next three weeks is given below:

B11 - Friday, 27th April
B12 - Thursday, 3rd May
B13 - Thursday, 10th May
B14 - Wednesday, 16th May

DELAYS TO UNITED STATES PATENTS

A table summarising the effects of the delays due to printing difficulties at the U.S. Patent Office is given below:

Week	Patents Published	Delay in publication of patents
B08	15 August 1978	12 Weeks
	13 February 1979	No delay

process is described in which a satd.

773119 (+22.1.75 - US - 542907) (8pp1379).

exchange resin beds, sodium hydroxide eluted from the anion exchange resin is removed. This reduces the amt. of waste soln. for washing or eliminates the washing step for the preceding process. 28.6.77. as 076179 (6pp43)

NISO ★ D17 18771B/10 ★J5 4011-247
Starch treated with oils and fats - to improve gel characteristics in highly conc. starch paste
NIPPON SHOKUHIN KAK KK 25.06.77-JA-075736
(27.01.79) C13l-01/08

Process comprises adding 0.005-10 wt.% of oil and fat with >130 iodine value to starch to be adsorbed uniformly onto the starch. The oils and fats are e.g. of both plant or animal origin like sunflower (sic) oil, linseed oil, and sardine oil, which is e.g. added directly, in emulsion or in soln., to starch e.g. corn starch and wheat starch.

The processed starch shows improved gel characteristics in highly conc. starch paste, and exhibits improved viscoelasticity characteristics and ageing resistance, being obtd. without heating. In an example, emulsion of 2 pts. sardine oil in 200 pts. water was added to 2500 pts. suspension contg. 40% corn starch, stirred and dehydrated by centrifuge. The cake was dried and the prod. with 13% moisture content showed increased gel strength, and improved stability. 25.6.77. as 075736 (3pp43)

NISO ★ D17 18772B/10 ★J5 4011-248
Processed starch useful e.g. in paper industry - prepd. by mixing starch with fats and oils and metal (cpd.)
NIPPON SHOKUHIN KAK KK 25.06.77-JA-075737
(27.01.79) C13l-01/08

Prodn. of processed starch comprises admixing for adsorption with starch 0.005-10 wt.% of fats and oils, and 0.001-10 wt.% against the fat and oil as converted to single metal of magnesium, aluminium, calcium, iron, cobalt, copper, zinc or lead, (in)organic cpd. thereof.

The oil or fat is e.g. linseed oil, sunflower(sic) oil or sardine oil. The processed starch, utilising a small amt. of metals, has the oil and fat partic. strongly adhered on the surface and is mutually bonded among the particles. The starch can be converted to paste at lowered temp., and shows improved physical properties like viscoelasticity and adhesion, thus being useful in paper, corrugated board and other industries.

In an example, cobalt stearate 0.5 wt.% against soyabean oil was added to starch of 13% water content at a ratio of 5 pts. of oil + metal cpd. per 1000 pts., and stirred for 20 min. at room temp. The processed starch showed gel strength of 347 g and adhesion of 18.3 kg. 25.6.77. as 075737 (5pp43)

AJIN ★ D17 18773B/10 ★J5 4011-249
Non:agglomerated oil-processed starch giving lower viscosity slurry - produced in the presence of fatty acid mono:glyceride
AJINOMOTO KK 28.06.77-JA-076855
(27.01.79) C13l-01/08

An improved oil-processed starch (I), is produced by contact of starch (II) with oil (III) and fatty acid monoglyceride (IV), for fixation of (III) and (IV) in (II).

In the priorart, (I) is produced by the treatment of (II) with (III) contg. triglyceride. Adhesiveness of the product is so high that many lumps are formed during storage and the product adheres to the surface of appts. The viscosity of a slurry of this prod. is high and foam is generated from the slurry. These problems are overcome by use of (I) produced by the present method.

Typically (II) is corn starch, wheat starch, potato starch, tapioca starch or sweet potato starch; (III) is soy bean oil, rapeseed oil, olive oil, corn oil, palm oil, lard, tallow, sardine oil, whale oil or cuttle fish oil; (IV) is monoglyceride of lauric acid, myristic acid, stearic acid, oleic acid, linolic acid or linolenic acid; (II) may be contacted with (III) contg. (IV) or with (III) after or before the contact with (IV). The amt. of (III) mixed with (II) is 0.003-10% on (II) and the amt. of (IV)is 0.1-5 times that of (III). 28.6.77. as 076855 (6pp42)

STRK D17 01838S/01 =NL -159-286
Continuous crystallisation procedure
STORK-WERKSPOOR-SU (SUI - STRK) 26.09.69-NL-014625
*J01 (15.02.79) *BE-752-565 B01d-09/02 +C13f-01/02*

A crystallisation process is described in which a satd. salt soln. is seeded and the supersatd. soln. is fed into the lower end of a crystallisation vessel. The vessel is divided into compartments, each compartment communicating with its neighbouring compartment and each with an additional supply of seeding solution so that the required degree of supersaturation is maintained.

The pressure in the lowest compartment is controlled and the inclination of the vessel to the vertical determines the pressure gradient through the vessel. Each successive compartment is larger than the previous one to ensure that the same dwell time exists in each. Vapour and crystals are removed at the upper end of the vessel. 26.9.69. as 014625 (6pp1370)

STRK D17 01837S/01 =NL -159-437
Crystallizer for producing crystals from - a seeded saturated solution
STORK-WERKSPOOR-S (SUI - STRK) 26.09.69-NL-014626
*J01 (15.02.79) *BE-752-564 B01d-09/02 +C13f-01/02*

A crystallisation vessel comprises a cylinder into the lower end of which a satd. salt soln. is fed whilst, at the higher end, the crystals are removed. At the highest point there is a vacuum connection. A screw feeder coaxial with the cylinder rotates at such a speed that the coaxial velocity component is equal to the desired flow velocity thus reducing the turbulence but preventing the downward flow of agglomerates of crystals. The appts. can be tilted around a horizontal axis so that its inclination to the vertical and hence the pressure gradient in the solution can be varied. In an alternative form, the cylinder consists of two telescoping parts so that the length of the system and hence the dwell time of the solution can be varied. In a second alternative an extra tapered section is incorporated at the upper end. 26.9.69. as 014626 (7pp1370)

GENM D17 12381B/07 =US 4141-747
Large granule starch sepn. from native starch - by fractionation of starch slurry through several hydrocyclone separators and recycle of some streams
GENERAL MILLS CHEM (STAL) 04.08.77-US-822013
*G05 (27.02.79) *EP-----820 C13l-01/08 +C08l-03/02*

A large granule starch prod. is obtd. from native starch having a wide range particle size distribution. Starch is obtd. from wheat, barley or rye starches.

Prepn. is from initial aq. feed starch slurry at ≯15° Be from granular starch having particle size distribution contg. >20 wt.% starch, dry solids basis is 20-32 microns, 50-55 wt.% is 16-32 microns, and 45-50 wt.% is 2-16 microns, slurry is fed to first hydrocyclone separator to yield first aq. slurry at ≯22° Be and second aq. slurry at 8° Be; first aq. slurry is fed to second hydrocyclone separator to yield first recirculation stream of 3-5° Be and large granule stream of 18-22° Be; first recirculation stream is added to first hydrocyclone separator; second slurry from first separator is fed to third separator to yield by-product and second recirculation stream having ≯22° Be; second recirculation stream is fed to first separator; large granule stream is collected from second separator.

Starch prod. is used in carbonless copy paper coatings, obtd. in improved yield. 4.8.77 as 822013 (5pp931).

SCON D17 60645W/37 =US 4141-839
Multihydrocyclone for starch processing - has inserts with individual channels in common overflow and discharge chambers
SCHOLTEN-HONIG NV (SCFA) 23.02.74-DT-408767
*J01 P41 (27.02.79) *DT2408-767 +B01d-21/26 B01d-33/02*

A multihydrocyclone comprises parallel connected hydrocyclones having their overflow pipes and drains opening into respective headers.

The headers are each formed of an assembly of discharge conduits which terminate into collecting conduits having a throughf-low area proportional to the local amts. of flow. The discharge and collecting conduits are pref. constructed as recesses in parts of the cyclone housing, which is pref. cylindrical.

The flow velocity of effluent fractions is maintained at the desired level throughout, and thus prevents fouling, e.g. when processinf starch from potatoes. 28.2.77 as 773119 (+22.1.75 - US - 542907) (8pp1379).

MOBI ★ D17 19908B/10 ★US 4141-842
Oil recovery by waterflooding with thickened fluid - contg. xanthan gum, alcohol and alkali metal carbonate
MOBIL OIL CORP 28.03.77-US-782141
A97 E17 H01 Q49 (D16 E34) (27.02.79) E21b-43/22

Waterflooding of oil reservoirs having a temp. of >60°C is carried out using an aq. fluid contg. (a) a water-dispersible polysaccharide produced by the action of a Xanthomonas bacterium on a carbohydrate ("xanthan gum"); (b) 0.1-2.0 (pref. 0.1-1.0, esp. 0.1-0.5) vol. % of a 4-5C aliphatic alcohol; and (c) 0.001-0.1 (pref. 0.001-0.01, esp. 0.001-0.005)wt. % of an alkali metal carbonate.

The xanthan gum is suitably a commercial product of the "Kelzan" type. The alcohol is pref. n-butyl or isobutyl alcohol. The carbonate is pref. Na_2CO_3, used in an amt. sufficient to give a pH of 8.5-10.

The alcohol stabilises the xanthan gum against thermal degradation, and the alkali metal carbonate synergises this stabilising effect. 28.3.77 as 782141 (9pp367).

JOBB ★ D18 18063B/10 ★BE -871-561
Mfg. synthetic fibre sheet for cigarette filter tips - by spraying binding agent onto drum supported sheet
SOC JOB ANC ETAB BARDOU 23.12.77-FR-038957
A88 F04 P15 (A11) (15.02.79) A24c B01d D04h

A device is provided for applying a binding agent to a continuous sheet composed of short, synthetic fibres, e.g. of cellulose acetate, intended for the mfr. of filter tips for cigarettes. The sheet is drawn through a spray cabinet in which one side of the sheet is exposed to a fine spray of binding agent. The area exposed to spray is now an arc of a cylinder formed by the sheet lapping an arc of a support drum contacting the unsprayed face of the sheet. The sheet is held in contact with this arc by two jockey rollers on axes parallel to that of the support drum.

The effective arc of the support drum pref. extends into the spray cabinet chamber and deflectors are used to limit the sprayed area to a positively supported section of the sheet.

The delicate sheet is well supported as it travels through the spray cabinet. Previously, there was danger of tearing or snagging the sheet by friction against stationary parts of the cabinet. 26.10.78 as 871561 (8pp448)

DREE- D18 27742T/18 =DS 2050-539
Hydraulic setting - for counterpressure roller in a shaving machine according to material thickness
DREES & CO GMBH (BAY -) 15.10.70-DT-050539
*+P62 (01.03.79) *DT2050-539 C14b-01/06*

In a machine for trimming hides and skins to a uniform thickness, having a cutting cylinder and a counterpressure cylinder, the counterloading of the bearings is adjusted to suit the degree of deflection occurring during the passage of the leather.

Alongside the bearings of the cutter and counterpressure cylinders, and on their shafts, hydraulic tightening bearings exert counterloading to the deflection of the cylinders. The degree of counterloading is adjusted automatically by signals from a monitor which may act optically, pneumatically, etc. 15.10.70 as 050539. (4pp1045)

BRUG/ ★ D18 18469B/10 ★FR 2393-068
Shaped leather panels stiffened by internal coatings - of wax, rubber soln. or thermoplastic resin
BRUGUIERE H 03.06.77-FR-017015
A82 (02.02.79) C14b-01/56

Panels of natural or synthetic leather are shaped in high relief by close application as pliant damp hides, to the surface of a suitable three dimensional pattern and then allowed to dry until rigid. The hide is carefully removed from the pattern and then coated internally with a hardenable dressing of wax, rubber soln. or thermoplastic resin to stabilise the hollow shape. Opt. the external surface is also decorated with e.g. paint, flock, etc.

Esp. suitable for mfr. of miniature masks or models from e.g. sheep or goat hide. 3.6.77 as 017015. (7pp515)

YAMA/ ★ D18 18748B/10 ★J5 4011-201
Incombustible, flexible moulded prod. contg. waste leather - and porous inorganic insulating material, and coated with refractory material
YAMADA T 24.06.77-JA-075951
E37 (E16 E17) (27.01.79) C14b-07/04

The prod. is produced by adding to water thiourea, burnt alum, calcium silicate, ethylene glycol and soluble alkali metal salt of silicic acid to form a soln., admixing a soln. of phosphate, fluoride, halogenated hydrocarbon or halogenated hydrocarbon solvent with silicate oxide, borate and metal borate, adding pieces and powder of leather and porous inorg. material, admixing the two mixts., moulding, and coating layers, dots, hemispheres or triangular forms of refractory material resisting direct fire on the resulting moulding, opt. followed by coating heat-insulating material on the reverse side.

The prod. has air-penetrating, heat, insulating, fire proofing, and flexible properties, and resists flame of temp. ca. 750°C thus providing a new application for waste leather. 24.6.77. as 075951 (4pp43)

BRTA D18 20415U/15 =NL -159-448
Cigarette papers treated with sodium/potassium chlorates - - as burn control additives
BRIT AMER TOBACCO LTD (BRWI) 13.03.72-US-234210
*E34 F09 P15 (15.02.79) *US3722-515 D21h-05/16*

Cigarette has a paper covering, carrying thereon a pattern of rectangular areas of oxidation accelerator comprising $KClO_3$ and $NaClO_3$ in molar ratio of 2.6-10:1.

Specifically the treated atea of the cigarette paper is 3-40 cm^2, and the chlorate ion content of the treated area is 0.7-1.3 mg/cm^2. The oxidn. accelerator produces a smoke with considerably reduced amts. of undesirable components. The treated cigarettes can be kept under extremely moist conditions without loss of quality. 9.3.73. as 003392 (5pp913)

PLTE D18 32885Y/19 =US 4141-869
Heat sealing melt adhesive - comprising silicone cpd., pref. silicone oil, added to thermoplastic polymer e.g. copolyamide
PLATE BONN GES 14.10.75-DT-545874
*A81 F06 G03 (A23 A26) (27.02.79) *DT2545-874 +C08j-69/44 C08k-05/54 C08l-77*

Heat-sealing thermoplastic adhesive of thermoplastic polymer is prepd. which is resistant to washing and dry-cleaning.

Compsn. contains copolyamides contg. 80-20 wt. % lauric lactam and 20-80 wt. % $>$1 other polyamide forming material; copolyamides contg. 25-35 wt. % caprolactam, 20-40 wt. % lauric lactam, 9-25 wt. % hexamethylene diamine adipate and 10-40 wt. % HOOC-$(CH_2)_n$-COOH where n is 7-11; copolyamides contg. 30 wt. % caprolactam, 30-35 wt. % lauric lactam and 10-15 wt. % hexamethylene diamine adipate; copolyamides contg. 30 wt. % caprolactam, 30-35 wt. % lauric lactam, 15-35 wt. % HOOC-$(CH_2)_n$-COOH; copolyamides of polyamide-forming amide salt contg. $\geqslant$10C, polyamide omega-amino acid and opt. polyamide-forming lactam; or copolyamide of -forming amide salt contg. $>$ 10C, polyamide-forming lactam and crystallisable copolyesters based on terephthalic acid or diol.

Used for bonding substrates hydrophobically finished with silicone cpds., such as raincoat fabrics. 28.9.76 as 727512 (4pp931).

PHIM D18 53770Y/30 = US 4141-906
Smoking compsns. contg. beta-hydroxy esters or acids - giving fruity flavour that is preserved during processing and storage
PHILIP MORRIS INC 20.02.76-US-659691 (03.05.77-US-793400)
*E14 P15 (E13) (27.02.79) *US4036-237 + C07d-317/44*

Ethyl 2,2-dimethyl-3-hydroxy-3-(3',4'-methylenedioxyphenyl)-propionate and 2,2-dimethyl-3-hydroxy-3-(3',4'-methylenedixoyphenyl)propionic acid are new. The cpds. are used to release cherry or fruity flavour upon smoking. The flavours are kept and preserved on processing and during storage.

In parent patent, the smoking prod. contg. the β-hydroxy ester or acid of formula $R-CH(OH)CR_1R_2-COOR_3$ is claimed. In the formula, R is Ph, 4-methoxyphenyl, 3',4'-methylenedioxyphenyl, 4',5'-dimethoxyphenyl, 4'-methoxyphenyl or PhCH=CH-; R_{1-2} are each esp. Me or Et; and R_3 is H, alkali metal or 1-8C alkyl. 3.5.77 as 793400 Div. ex 4036237 (5pp982).

Cosmetics contg. polymers of unsatd. cpds. with hydroxylic cpds. - prepd. in aq. medium in presence of cerium ions

L'OREAL SA 15.10.75-LU-073587

*A96 (07.03.79) *BE-847-267 A61k-07*

Cosmetic compsn. contains in cosmetic vehicle $\geqslant$1 copolymer obtd. by copolymerising an unsatd. monomer with cpd contg. $\geqslant$1 -OH gp., in aq. medium and in the presence of cerium ions, the compsn. being free of cerium ions.

Pref. cerium ions are derived from cerium ammonium nitrate. Hydroxyl-contg. cpd. is pref. gelatine, cellulose, (modified) starch, collagen, a chitosan, nitrocellulose, a cellulose ether or cellulose carrying cationic gps. Unsatd. monomer is pref. derived from (meth)acrylic acid.

Compsns. are applied in the form of wave-setting lotions or in lacquers to the hair, to produce an excellent hold of the hairstyle and render the hair soft and glossy. Used as shampoos, rinses or dye compsns. 15.10.76 as

42951 (24pp931)

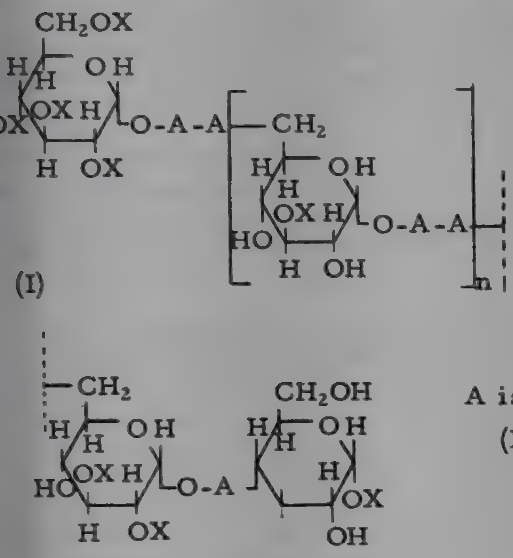
KANE ★ D21 18689B/10 ★J5 4011-108

Storage stable shampoo compsn. - contains anionic and nonionic surfactants and polysaccharide e.g. pullulan deriv.

KANEBO KK (SUMO) 27.06.77-JA-076838

A96 (27.01.79) A61k-07/06 C11d-03/37

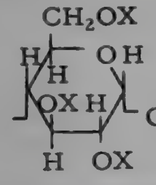
The shampoo compsns. comprise 0.2-7 wt.% of a polysaccharide cpd. of formula (I):



(I)

A is gp. of formula (II):-

(II)



where n is an integer of 40-200, X is a gp. $-R_1-N(R_2)R_3$ (where R_1 is 1-5C alkylene or 1-4C hydroxyalkylene and R_2 and R_3 are each H, 1-4C alkyl, phenyl or 1-4C alkyl-substd. phenyl and the ratio of number of X to that of H is 0.01-2) together with a shampoo base comprising anionic (e.g., soaps, sulphate ester salts of higher alcohol /polyalkylene glycol ether, sulphate esters of higher alcohols and their mixt.) and nonionic surfactant (e.g., alkylolamides of higher fatty acids, etc.) opt. in combination with an amphoteric surfactant (alkyl betaine type or imidazoline type, e.g., alkyldiaminoglycine hydrochlorate, etc.). (I) is e.g. pullulan-diethylaminoethylether (degree of polymerisation: 510; degree of substitution: 0.50).

The compsns. have excellent shelf life, affording flexible hair and preventing the hair from splitting. 27.6.77. as 076838 (6pp59)

LIOC ★ D21 18757B/10 ★J5 4011-223

Bathing compsn. - contg. inorganic reducing agent and azo-, quinoline-, tri:phenylmethane-, indigo- or natural dyestuff

LION DENTIFRICE KK 00.00.78-JA-003505 (04.04.74-JA-037367)

E24 (E33 E34) (27.01.79) A61k-07/50

Bathing compsn. contains (a) $\geqslant$1 inorganic reducing agent (I); and (b) azo gp., quinoline gp., triphenylmethane gp., indigo gp. or natural dyestuff as main dyestuff.

The compsn. shows dyestuff-stabilising action. Pref. (I) is Na-, Ca- and/or K bisulphite and/or Na thiosulphate.

A typical compsn. contained Na hydrogensulphite (1.40×10^{-5} mol/L), standard chlorine aq. soln. 1.0 ppm (1.43×10^{-5} mol/L) and yellow No. 4 dyestuff (0.6 mg/ 100 ml λ max = 428 mμ). 4.4.74. as 3505/78 Div. ex. 37367/74 (4pp69)

SHIS ★ D21 18765B/10 ★J5 4011-238

Solid cosmetics having good smoothness and adhesion - comprising mainly sericite powder of specified particle size and an oil component

SHISEIDO KK 27.06.77-JA-076347

(27.01.79) A61k-07/03

Solid cosmetic material is composed mainly of sericite powder of av. particle size of ca. 5u and max. particle size of<20 micron and an oil component at a ratio of 50-80%: 8-15%.

Cosmetics pref. further comprise 5-20% kaolin and/ increase impact resistance. The oil components are e.g. oils of plant, animal or mineral origin and synthetic oils e.g. liquid paraffin or lanolin. Perfumes may be added with antiseptics, UV absorbers and other additives e.g. vitamins, dyes and pigments.

Cosmetics show very good smoothness and increased adherence, produce novel feel in usage, while exhibiting the improved mouldability and impact resistance. 27.6.77. as 076347 (3pp43)

SEIK- ★ D21 18766B/10 ★J5 4011-239

Scurf- or dandruff-preventing agent - comprises a rosin obtd. by steam distilling turpentine collected from plants of the pine genera

SEIKEN KAGAKU KK 27.06.77-JA-075509

(27.01.79) A61k-07/06

The rosin is produced by steam-distilling turpentine collected from plants of pine genera to remove turpentine oil, and purifying the residue. The rosin is composed of abietic acid and other rosin acids, and is free from odour and toxicity. The rosin may be added to shampoos, hair tonics, or other hair dressing agents. The agent completely prevents scurf development and itching.

In an example, 60% ''Haitenol'' (RTM), 5% ''amizol'' (RTM) 15% ''Softazolin'' (RTM), 0.1% EDTA:2Na, 0.02% BHA, 0.3% perfume, 5% propylene glycol, 2% rosin and 9% polyoxyethylene oleyl ether, and balance water, were mixed to produce a scurf-preventing shampoo which showed improved scurf prevention effect. 27.6.77. as 075509 (3pp43)

SUNZ ★ D21 18767B/10 ★J5 4011-242

Dentifrice compsns. - contg. (N)-acyl glutamic acid salt and sodium acyl sarcosine or sodium (N)-acyl-(N)-methyl-beta alanine

SUNSTAR HAMIGAKI KK 24.06.77-JA-076020

E16 (E12) (27.01.79) A61k-07/22

Dentifrice compsns. are composed of an N-long-chain acyl glutamic acid salt (I) and sodium acyl sarcosine or sodium N-acyl-N-methyl-beta-alanine as foaming agent.

(I) is e.g. monosodium salt with a fatty acid residue of tallow constituting the long-chain acyl, which is lower in toxicity, and formulated at a ratio of 0.5-3%. Sodium sarcosin or the alanine deriv. is e.g. formulated at a ratio of e.g. $<$ 0.5% and 0.75%, respectively. The compsns. may be in the form of a powder or paste. Compsns. leave no abnormal taste.

In an example, 40% $CaCO_3$, 0.5% CMC, 0.5% kalaginan (sic) 13% glycerin, 7% sorbitol, 1.5% silicic acid, 33.9% water, 2% N-acyl glutamate (Amisoft (RTM) of Ajinomoto), 0.1% bactericide, 0.5% sodium lauryl sarcosine and 1% perfume were mixed to produce a dental paste with improved foaming property. 24.6.77. as 076020 (4pp43)

LIOC ★ D21 18768B/10 ★J5 4011-243

Tooth-paste with improved scale prevention property - comprises chlorhexidine salt, sodium mono fluorophosphate and carrageenan

LION DENTIFRICE KK 24.06.77-JA-075148

E34 (E14) (27.01.79) A61k-07/18

Toothpaste compsns. are composed of chlorhexidine salts, sodium monofluorophosphate and karagenane. The karagenane is e.g. a mixt. of k-karagenane and i-karagenane in a ratio of 8:2 to 1:9.

The compsns., contg. chlorohexidine, have improved scale preventive effect, and contg. sodium monofluorophosphate, exhibit improved decay preventive effect, and are free from cohesion. They are storage stable and easily extruded from tubes. 24.6.77. as 075148 (8pp43)

KANE ★ D21 18769B/10 ★J5 4011-244

Nail varnish which is not harmful to skin and nail - comprises a modified polyester in an organic solvent with nitrocellulose

KANEBO KK 23.06.77-JA-075020

A96 (A23) (27.01.79) A61k-07/04

The varnish is composed of a modified polyester, produced by addn. react. of a dioxirane cpd. with polyester from polycondensation reaction of cyclohexane-1,2-dicarboxylic acid, dipentaerythritol and monobasic higher fatty acid, dissolved in organic solvent along with nitrocellulose.

The monobasic fatty acid is e.g. 18-20C higher fatty acid, like (hydrogenated) castor oil fatty acid, steric acid and oleic acid. The polycondensation reaction is effected e.g. with 60-90 equiv.% of carboxyl of the cyclohexane-1,2-dicarboxylic acid based on hydroxyl of dipentaerythritol, at 100-200°C, to form a polyester of no. ave. mol.wt. 1500-2500. The addn. reaction is effected using 0.5-15 wt.% (of the polyester) of dioxirane cpd., like those of mol.wt. 500-1400, e.g. condensate of epichlorohydrin and Bisphenol A, at 160-185°C to produce a modified polyester of no.ave. mol.wt. 1800-4000, which is e.g. formulated at a ratio of 0.5-15 wt.% with 10-20 wt.% nitrocellulose.

The varnish is based on a solvent comprising toluene, lower alcohol ester of acetic acid, and aliphatic monohydric lower alcohol. 23.6.77. as 075020 (6pp43)

INAL- D21 29511F/00 =NL-159-280
Lotion for preventing hair loss contng procaine benzoic
MINISTER IND ALIMEN (MINA) 16.05.66-RU-051474
*B05 E19 (15.02.79) *NL6702-282 +A61k-07/06*

Lotion for the care, new growth, pigmentation or prevention of fall-out of hair, has a pH 2-6 and comprises (by wt.) 0.5-5% procaine acid addn. salt, 0.1-0.5% benzoic acid and 0.1-0.5% ascorbic acid, mixed with conventional cosmetic ingredients, dissolved, emulsified or dispersed in wetter or organic solvent. Pref. the lotion contains hydrocarbon(s) to degrease the hair.

Results depend on the age of the patient and condition of the hair. Typically irritation of the scalp and dandruff are eliminated after ~1 month; fall-out ceases and new growth starts after 2-3 months; grey hair is strongly pigmented after >6 months. The lotion can also be used in the prophylaxis of baldness. 15.2.67. as 002282 (3pp913)

Durable dental prostheses prodn. - additionally contains grafted copolymer of methyl methacrylate and polyvinyl ethyl:al, to improve strength
LENGD PAVLOV MEDICA (ASHI=) 07.12.76-SU-427609
A14 P32 (A96) (21.03.78) A61c-09

Dental prostheses are produced from a compsn. contg. (in wt. %): methylmethacrylate 28.0-29.5, grafted copolymer of methylmethacrylate and polyvinylethylal 65.7-68.0, triethylene-glycoldimethacrylate 2.4-3.0, benzoyl peroxide 0.8-0.9 and dimethyl aniline 0.8-0.9. The grafted copolymer has increased strength and biological durability.

Shteingart, M.Z., Shtraikhman, G.A., Zaitsev, B.A. Bul. 15/25.4.78. 7.12.76. as 427609 (2pp1047)

LUST/ ★ D21 19780B/10 ★US 4141-144
Acrylic dental material contg. muscovite mica - to control lustre and hue, for making prostheses or for cosmetic application
LUSTGARTEN S J 26.01.77-US-762526
A96 (27.02.79) A61k-05/06 C08k-03/34

Dental material comprises a polymerisable resin binder (I) which is >1 acrylic monomer; an agent for polymerising (I), an inorganic filler and finely divided particles of translucent muscovite mica (II) at 1-20 wt.% to control hue and lustre.

Pref. (II) has particle size 1-50u and may be (partially) coated with BiOCl, ZrO_2 or esp. TiO_2. Specified (I) are methacrylates, cyanoacrylates, N-phenylglycine-glycidyl methacrylate reaction prod. or esp. 2,2-bis[4-(3-methacryloxy-2-hydroxypropoxy)phenyl]propane (Ia). Similar compsns. in which the filler is opt. and (II) is 1-30 wt.% can be applied to teeth surfaces.

The materials are used for fillings, restorations, etc. and addition of (IV) allows predictable control of hue and lustre. They can also be painted on teeth for cosmetic purposes. The materials are stable without the need for UV inhibitors or absorbers. 26.1.77 as 762526 (8pp1251).

UYVI- ★ D21 19921B/10 ★US 4141-864
Osseous cement for dental and orthopaedic use - comprises acrylic monomer, filler and particles leachable from the cured cement
UNIV OF VIRGINIA 16.12.77-US-861295 (15.03.74-US-451480)
A96 (A14 D22) (27.02.79) A61k-05/06 C08l-33/10

The cement comprises (a) 10-40 wt.% (in)organic particles (I) leached by extracellular fluid of the host to leave a continuous pore structure; (b) 20-40 wt.% acrylic monomer; (c) 35-65 wt.% insoluble, non-diffusing, particulate, physiologically acceptable filler of particle size <100µ to increase viscosity to a pliable, mouldable paste and (d) initiator system for the monomer.

(I) has average particle size 50-250µ; has about the same pH as extracellular fluid and has no effect on its ionic strength; is nontoxic; is hard and non-deformable so that proper size porosity is maintained; has m.pt. greater than polymerisation temp. of the monomer; and is not swellable or soluble in monomer or polymer.

Tissue can grow into the pores left by leaching of (I) so a longer lasting bond between bone and prosthesis is obtd. (I) acts as a heat sink reducing thermal necrosis of the bone; reduces the amt. of monomer used and prevents outward migration of the toxic monomer. 16.12.77 as 861295 (8pp1251).

COLG ★ D21 19956B/10 ★US 4141-947
Variegated soap bar mfr. - by blending minor soap ingredients soap chips, and colouring agent in a screw mixer
COLGATE PALMOLIVE CO 07.07.76-US-703159 (09.01.75-US-539675)
(27.02.79) B29f-03/12

Soap bar is produced by continuously feeding soap chips, and a pre-blended emulsion of minor soap ingredients and colouring material into the hopper of a mixer unit that includes a screw mixer conveyor, and operating the mixer to blend the minor ingredients other than the colouring material throughout the mass to produce a variegated homogeneous soap mass at the discharge end of the conveyor. The mass is supplied to a double barrel vacuum plodder, and then the plodded mass is extruded and cut into bar form.

Provides a high speed continuous process for making variegated soap of uniform high quality, while avoiding the separate introduction of the various ingredients into the mixer. 7.7.76 as 703159 (5pp50).

Woody material treating agent - contg. alkyl isocyanurate as active component
CHUGAI PHARMACEUTICAL KK 24.06.77-JA-074527
C02 E13 F09 P63 (27.01.79) A01n-09/22 B27k-03/40

Woody material treating agent contains as active component trialkyl isocyanurate (I). (I) is esp. active against wood-putrefying bacteria and white ants, has a low toxicity to human beings and can be used safely. Wood-putrefying bacteria to which the agent is applied include Trichoderma viride, Aspergillus niger and Penicillium notatum.

Agent may contain insecticide, fungicide and/or antiseptics. In an example, 50 pts. wt. (I), 5 pts. wt. dodecylbenzenesulphonate, 5 pts. wt. polyoxyethylene alkylallyl ether and 40 pts. wt. xylene were mixed to prepare an emulsion. 4 pts. wt. of (I) and 96 pts. wt. methylnaphthalene were mixed to prepare a soln. 24.6.77. as 074527 (3pp108)

JAPS ★ D22 18763B/10 ★J5 4011-234
Deodorising compsn. for treating rubber, etc. or for household use - comprising conifer essential oil and citrus type aroma
JAPAN SYNTHETIC RUBBER 27.06.77-JA-076293
*A60 P34 (27.01.79) A61l-09/**

Deodorising compsn. contains (1)$\geq$1 coniferous tree type essential oil and/or component obtd. by extraction of such oil and (2)$\geq$1 citrus type aroma and/or component obtd. by extraction of such aroma in a wt. ratio of $20 > (1)/(2) > 1/29$.

Compsn. has little fragrance and has an effective deodorising action. The deodorising effect is synergistically increased by combined use of the conifer essential oil and citrus type aroma. Compsn. is effective against the smell of uncured rubber, smell generated at the time of processing rubber or curing rubber, smell of regenerated rubber, smell of polymer compsns. and smell generated when heating polymer compsns. at high temp. It is also suitable for household use.

As conifer type essential oil there is used e.g. Japanese cypres oil or Japanese Cedar oil. As citrus type aroma there is used e.g. lemon oil, orange oil or synthetic lemon oil. Excipients and other additives may be added. The compsn. is used e.g. as spray liquid, gel or aerosol. It shows high deodorising effect in small amts. and the effect lasts for a long time even after the bad smell disappears. In an example, a compsn. of Japanese cypres oil and lemon oil (1:1) was added to melted cured rubber in an amt. of 0.1 wt.%, and the bad smell was scarcely perceptible whereas the bad smell was noticeable when only Japanese cypres oil was used. 27.6.77. as 076293 (6pp108)

Body fluid absorbing sheet - with permeable polypropylene fibre mat over absorbent cellulose mat on polyethylene foil backing BE160776)
TEVIC INT BV 24.01.75-NL-000874
*A96 F07 P21 P32 +P34 P73 (15.02.79) *DT2601-617 A61f-13/18 A61l-15 +B32b-05/26 B32b-07/04*

A moisture absorbent product is described consisting of $\geq$1 layer of a moisture absorbent material and covered, on one side, with a layer of permeable, moisture resistant material containing polypropylene fibres. Pref. the two layers are separated by a fibrous mat with a contact surface ratio of $<0.5\%$.

As there is a minimum of mechanical contact between the cover layer and the absorbent material, there is negligible flow back of absorbed moisture through the cover. 24.1.75. as 000874 (4pp1370)

BURN- ★ D22 19420B/10 ★NL-159-299
Container washing, sterilising and filling installation - e.g. for beer barrels, with reduction of cycle time by removing barrel from sterilising station after initial charge
BURNETT & ROLFE 21.11.66-GB-052017
P43 Q39 (D16) (15.02.79) B08b-09/12 B67c-03/30

The installation consists of a continuous chain transporting mechanism which transfers the barrels between three stations, the wash and sterilising station, the inverting station, and the filling station. The barrels are equipped with self-closing valves and connectors which connect to the delivery line connectors for the wash water, steam or fill liquid. At the first station, the barrel is washed and then charged with steam. It is then removed to the second station where it makes contact with a time delay switch which prevents the barrel from being inverted until the sterilisation period is complete. The barrel is then inverted and transported to the fill station.

The installation differs from the traditional system in that the barrel can be immediately removed from the first station after being charged with steam instead of having to remain coupled to the steam supply until the sterilisation is complete. Consequently, the cycle time is considerably reduced. 17.11.67. as 015679 (5pp1370)

(I)

Process is improved by using as a catalyst a sulphonate (pref. an alkylarylsulphonate contg. 1-24C in the alkyl(s) and opt. up to two carboxyl gps.) or a carboxylate of Pb, Zn, Cd, Sn, Ti, Zr, Cr, Sb, Mn, Fe, Ni or Co. The temp. is pref. 220-240°C until 30-70% of glycerol is removed; then the temp. is increased gradually or stepwise (over 0.5-
5h) to 270-300°C, and the reaction is completed at this
temp.. The reaction mixt. is then subjected to fraction-
ation; the fatty acid amides are recycled, the fatty acid
nitriles $R_1(R_{21}R_3)CN$ are sepd. from the aq. phase, from
which glycerol is subsequently sepd. by the known meth-
ods.

Method is esp. suitable for processing natural, vege-
table or animal fats, but synthetic fats can also be used.
The one-stage process is relatively inexpensive. High
yields are obtd. (fatty acid nitriles ⩽ 97% theor.; glycerol
⩽ 95% theor). The process can be carried out continu-
ously. The fatty acid nitriles can be converted into corresp.
amines by hydrogenation. 20.8.77 as 737607 (20pp70).

Fat rendering unit - has tangential inlet for heat carrier into tapered chamber

SVERD MEAT COMBINE 23.02.76-SU-327100

(16.03.78) C11b-01/16

Improved efficiency of fat rendering unit is due to its melting chamber with peripheral tangent input of the heat carrier. The section of the melting chamber increases in the direction of fat stock motion while the section of the heat carrier chamber decreases.

The raw fat material is fed from the hopper to the rotating perforated drum for preliminary cutting by knives. The cut pieces are thrown to the inner wall of the drum by the centrifugal forces and are forced through the perforations. They drop into the annular melting chamber which receives the heat carrier through the tangent inlets. The direct contact of the carrier with the fat material ensures intensive rendering.

Rotary press for soap tablets mfr. - has transporter ring with spring-loaded flange section and transition plate to protect easily damaged products

PRONIN O YA 03.11.75-SU-186555

P52 P71 (28.03.78) B21j-07/14 B30b-11/12

The rotary press body is equipped with a rotary table which carries several sets of moulding tools consisting of the die sets are companion ejector rods actuated by a cam. The semi-finished products are fed in along the loading chute by means of a small conveyor.

Around the rotor is a ring whose upper edge is located below the chute to enable the pressed tablets of soap to pass under the chute thereby maintaining a path which is devoid of collision possibilities. Adjacent to the ring is a plate for the outfeed guide and the conveyor. There is a guard flange to prevent the completed tablets from falling off the ring. This is comprised of a series of movable sections each held in position by a spring. The sections are depressed as they approach the outlet point by the guide cam so that they pass under the plate.

Further protection is provided for the soap tablets, or similar easily-damaged products, by a transition plate which connects the die outlet area the ring, and the angle

racket ejectors fitted to the ends of the rods.
